

energy used by indian households 1999-2000

**NSS 55TH ROUND
July 1999 - June 2000**

**National Sample Survey Organisation
Ministry of Statistics & Programme Implementation
Government of India**

August 2001

PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all-India household surveys on Consumer Expenditure and Employment & Unemployment with a large sample usually once in every five years. The sixth such survey was conducted in the 55th round (July 1999-June 2000) - which covered Non-agricultural Enterprises in the Informal Sector in addition. The schedule of enquiry on Consumer Expenditure for the survey was, more or less, similar to that adopted in previous quinquennial rounds.

The present report is the sixth in the series of reports through which the results on consumer expenditure survey are being released. This report deals with the distributions of households by occupational type, social group and size class of land possessed (for rural only) for each primary source of energy used by the Indian households for cooking or lighting. It also brings out the distribution of households by monthly per capita expenditure (MPCE) class for each source of energy for cooking or lighting.

This report has four sections and one appendix. Section 1 of the report is introductory while Section 2 presents Sample Design and Estimation Procedure. Section 3 gives Concepts and Definitions. Section 4 discusses Survey Findings. The detailed tables are provided in the Appendix.

The Field Operations Division (FOD) of the Organisation conducted the fieldwork for the survey. The collected data were processed and tabulated by the Data Processing Division (DPD) of the NSSO. The Survey Design & Research Division (SDRD) of the NSSO developed the survey design and prepared the report.

I am grateful to the Chairman and members of the Governing Council, Heads of various Divisions of the NSSO and their colleagues for the contribution made in preparing the report.

Comments/suggestions from the readers will be most welcome.

New Delhi

Highlights

- Firewood and chips continued to be the most important source of energy used for cooking in rural India, with 76% of the rural households dependent upon it. Only 3% of households have switched away from this source since 1993-94.
- Firewood and chips (22%), kerosene (22%) and LPG (44%) are the important sources of energy used for cooking in the urban sector. There has been an increase of about 15 in the percentage of households using LPG and a decrease of 8% in the use of firewood/chips since 1993-94.
- The percentage of Indian households having “no cooking arrangement” was about 1 in the urban sector and 4 in rural sector. The households having no cooking arrangement were poorer than the average in urban areas but better off than the average in rural areas.
- In urban areas, the percentage of households using firewood and chips was the highest (53%) for ‘casual labor’ among the various household types. The national average was only 22%. The use of kerosene for cooking was also the highest (29%) for the casual labour households.
- Firewood and chips was used for cooking by more than 90% of households belonging to scheduled tribes in rural areas. The corresponding percentages were somewhat lower for the other social groups.
- At national level, electricity and kerosene accounted for 99% of the households as primary source for lighting in both rural and urban areas.
- There has been an increase in the proportion of households using electricity as major source of lighting by 11% (from 37% to 48%) in rural areas and by 6% (from 83% to 89%) in urban India since 1993-1994.
- There was decrease in the percentage of households using kerosene as primary source of energy for lighting, from 62% to 51% in rural India, and from 17% to 10% in urban India, since 1993-94.

Section One

Introduction

1.0 In the quinquennial surveys of household consumer expenditure, the National Sample Survey Organisation¹ collects data on primary source of energy for cooking and lighting as auxiliary information from households throughout the country. The results on the sources of energy for cooking and lighting of the sixth quinquennial survey (NSS 55th round) on Household Consumer Expenditure² conducted during July 1999 – June 2000 are presented in this report. The survey was spread over 6046 villages and 4116 urban blocks³ covering a total of 120309 households. This report is the sixth⁴ of a series of reports through which the findings of the survey are being released.

1.1 The entire area of the country - rural and urban - was covered, with the exception of Ladakh and Kargil districts of Jammu & Kashmir, 768 interior villages of Nagaland and 172 villages in Andaman & Nicobar Islands which remained inaccessible throughout the year. A few other areas of Jammu & Kashmir were also excluded from the survey coverage owing to unfavourable field conditions.

¹ **The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir.

² **Household consumer expenditure survey:** It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature. It was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. An annual series of consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be more useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. The six quinquennial surveys of consumer expenditure are the 27th, 32nd, 38th, 43rd, 50th and 55th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88, 1993-94 and 1999-2000.

³ Blocks are formed in Urban Frame Survey (UFS) conducted by NSSO. These are called UFS blocks. In Urban Frame Survey blocks of 120 – 160 households or 600 – 800 population are formed in the whole of urban areas of the country.

⁴ *NSS Report No. 453: Household Consumer Expenditure in India (July – December 1999) - Key Results*
NSS Report No. 454: Household Consumer Expenditure in India, 1999-2000 - Key Results

NSS Report No. 457: Level and Pattern of Consumer Expenditure in India, 1999-2000

NSS Report No. 461: Consumption of Important Commodities in India, 1999-2000

NSS Report No. 463: Sources of Household Income in India, 1999-2000

1.2 This report mainly gives per thousand distributions of households by primary source of energy for cooking or lighting for each household (occupational) type and social group. It also brings out the distribution of households by monthly per capita expenditure (MPCE) class for each source of energy for cooking or lighting.

1.3 A report⁵ was brought out on the same topic based on results of NSS 50th round (July 1993 – June 1994). However, that report contained only the distribution of households by use of primary sources of energy for different MPCE classes.

1.4 The Sample Design and Estimation Procedure followed in the NSS 55th round survey is given in Section 2. Section 3 presents important concepts and definitions adopted in the survey and used in this report. The survey findings on primary source of energy for cooking and lighting have been presented in Section 4. The detailed tables have been provided for each State, UT and all-India in Appendix.

⁵ Report no. 410/2: *Energy Used by Indian Households, NSS 50th round (July 1993 – June 1994)*

Section Two

Sample Design and Estimation Procedure

2.1 Sample Design

2.1.1 General: A stratified sampling design was adopted for selection of the sample first-stage units (FSU's). The FSU's were villages (panchayat wards for Kerala) for rural areas and Urban Frame Survey (UFS) blocks for urban areas. The ultimate stage units (USU's) were enterprises for schedule 2.0 and households for schedule 1.0/ 10/ 10.1, which were selected by the method of circular systematic sampling with equal probability from the corresponding frame in the FSU. Large FSU's were subdivided into hamlet-groups (rural)/ sub-blocks (urban) that were grouped into two segments, and USU's were selected independently from each of these segments. For the purpose of systematic sampling, households in the frame of second stage stratum 2 were arranged by means of livelihood and land possessed classes for rural samples and by means of livelihood and MPCE classes for urban samples.

2.1.2 Sampling frame for first stage units: List of villages (panchayat wards for Kerala) as per 1991 Census and latest lists of UFS blocks were respectively used for selection of rural and urban sample FSU's. For selection of sample villages from the State of Jammu & Kashmir, list of villages as per 1981 Census was used as the sampling frame. It may be mentioned that all the uninhabited villages of the country as per 1991 Census, interior villages of Nagaland situated beyond 5 km of a bus route and inaccessible villages of Andaman & Nicobar Islands were left out of the survey coverage of the NSS 55th round.

2.1.3 Stratification

2.1.3.1 Rural: Two special strata were formed at the State/ UT level, viz.,

Stratum 1: all FSUs with population between 1 to 100, and
Stratum 2: FSUs with population more than 15,000.

[Note: The above two strata were spread across a given state and were not confined to any particular administrative division within the state.]

The above-noted strata of either type were formed if at least 50 such FSU's were there in the respective frames. Otherwise, they were merged with the general strata.

While forming general strata (consisting of FSU's other than those covered under strata 1 & 2), efforts were made to treat each district as a separate stratum. If limitation of sample size did not allow the formation of many strata, smaller districts within a particular NSS region were merged to form a stratum. Each district with rural population of 2 million or more as per 1991 Census (1.8 million or more as per 1981 Census in case of Jammu & Kashmir) was split into a number of strata.

2.1.3.2 Urban : Strata were formed within NSS Regions as follows:

Stratum number	Composition of strata by considering population of various towns as per the 1991 Census
1, 3, 5 *	'hospital area' (HA) / 'industrial area' (IA) / 'bazaar area' (BA) blocks taken together, of each single city with a population of 10 lakhs or more (there could be a maximum of 3 such cities within an NSS Region)
2, 4, 6 *	Other blocks of each single city with a population of 10 lakhs or more
7	HA or IA or BA blocks of all towns with population between 50,000 and less than 10 lakhs
8	Other blocks of all towns with population between 50,000 and less than 10 lakhs
9	HA or IA or BA blocks of all towns with population less than 50,000
10	Other blocks of all towns with population less than 50,000

* Stratum numbers 3, 4, 5 and 6 remain void if there is only one city in an NSS region with a population of 10 lakhs or more.

If sample size was not adequate for forming so many strata, all blocks of stratum 7 were merged with those of stratum 8 and all blocks of stratum 9 were merged with those of stratum 10.

2.1.4 Sample size: A total number of 10,384 FSU's was selected for survey in the *central sample* at all-India level (rural & urban combined) in the 55th round. For *state sample*, there was normally an equal matching. Exceptions were only for Nagaland (urban), Delhi, Goa and Maharashtra (urban) where the state sample size was higher than central sample. Sample for the whole round for each State/UT and sector (i.e., rural/ urban) was allocated equally among the four sub-rounds. Sample FSU's for each sub-round were selected afresh in the form of two independent sub-samples. The details of allocation and survey of FSUs, households and persons were given in Statement 0.

2.1.5 Allocation of first-stage units (FSU's): State/ UT level rural sample size was allocated among the rural strata in proportion to population. State/ UT level urban sample size was first allocated among the three classes of towns (i.e., 10 lakh +, 50000 to less than 10 lakhs and less than 50000) in proportion to population. Then sample allocation for each of the three classes of towns, within an NSS region, was further allocated between two strata types consisting of - (i) HA/ IA/ BA blocks, and (ii) the rest, in proportion to total number of FSU's in the respective frames with double weightage given to

the first category of blocks. Stratum level allocations for both rural and urban areas of a sub-round were made in even numbers in order to facilitate selection of FSU's in the form of two independent sub-samples. Sub-sample numbers were 1 & 2 for sub-round 1; 3 & 4 for sub-round 2; 5 & 6 for sub-round 3 and 7 & 8 for sub-round 4.

2.1.6 Selection of first-stage units: For each sub-round, sample FSU's from each stratum were selected in the form of 2 independent sub-samples by following circular systematic sampling with (a) probability proportional to population for all rural strata other than stratum 1, and (b) equal probability for rural stratum 1 as well as all urban strata. Thus, stratum level allocation of FSUs was a multiple of 8.

2.1.7 Formation of hamlet-groups in large villages and number of hamlet-groups selected for survey : Depending upon the values of approximate present population (P) and approximate total number of non-agricultural enterprises (E), decision was taken to divide the FSU into a fixed number of hamlet-groups (hg's - the term applicable for rural samples) / sub-blocks (sb's - the term applicable for urban samples) as per the rules given below:

value of P	no. of hg's/ sb's formed in the FSU as per population criterion	value of E	no. of hg's/ sb's formed in the FSU as per enterprise criterion
(1)	(2)	(3)	(4)
Less than 1200	1 @	Less than 100	1 @
1200 – 1999	5	100 – 249	5
2000 – 2399	6	250 – 299	6
2400 – 2799	7	300 – 349	7
2800 – 3199	8	350 – 399	8
(and so on)		(and so on)	

@ no. of hb's/ sb's = 1 means the whole FSU is considered for listing.

[For rural areas of Himachal Pradesh, Sikkim and Poonch, Rajouri, Udhampur and Doda districts of Jammu & Kashmir, number of hg's formed in the village as per population criterion was: 1 for $P < 600$, 5 for $P = 600$ to 999, 6 for $P = 1000$ to 1199, 7 for $P = 1200$ to 1399, 8 for $P = 1400$ to 1599, and so on.]

The number (D) of hamlet-groups (hg)/ sub-blocks (sb) formed in the FSU was the higher of the two values as per population and enterprise criteria. If the value of P was less than 1200 (600 for certain hilly areas specified above) as well as the value of E was less than 100 for an FSU, hg/ sb formation was not resorted to and the whole FSU was considered for listing. In case hg's/ sb's were formed in the sample FSU, the same was done by more or less equalizing population.

2.1.8 Formation of segments within FSU: The hg/ sb having maximum concentration of non-agricultural enterprises was selected with certainty for listing of households/ enterprises. This hg/ sb was referred to as segment 1. From the remaining (D-1) hg's/ sb's of the FSU, 2 more hg's/ sb's were selected circular systematically and these 2 selected hg's/ sb's together were referred to as segment 2 for doing a combined listing of households/ enterprises. Thus, the listing of households/ enterprises was

done only in segments 1 and 2 of the FSU. The FSU not requiring hg/ sb formation was to be treated as segment 1.

2.1.9 Stratification of households : All the households listed in a segment (both rural & urban) were stratified into two second stage strata, viz., ‘affluent households’ (forming second stage stratum 1) and the rest (forming second stage stratum 2). In the rural sector, a maximum of ten households which were relatively affluent compared to others and possessed at least certain item(s) like motor car/ jeep, colour TV, telephone, etc. or owned land / livestock in excess of certain limits were included in second stage stratum 1. In urban sector, the households having MPCE (monthly per capita consumer expenditure) greater than a certain limit for a given town/city were treated as ‘affluent’ households for the present survey and were included in the frame of second stage stratum 1, and the rest of the urban households were included in the frame of second stage stratum 2.

2.1.10 Number of households/ enterprises selected for survey: The number of households/ enterprises selected for survey from each FSU in general is given below:

segment	number of households allotted for consumer expenditure schedule		
	second stage stratum (SSS)		
	1	2	total
(1)	(2)	(3)	(4)
FSU with hg/ sb formation:			
1	1	3	4
2	1	7	8
FSU with no hg/ sb formation:			
1	2	10	12

2.2 Estimation Procedure:

2.2.1 Approach: The estimate for a sub-round was obtained by combining the estimates of the corresponding sub-sample replicates. Similarly, an estimate for the Round was obtained by combining the four sub-round-wise estimates.

2.2.2 The following notations are being used in this section:

- a = subscript for the a-th stratum
- r = subscript for the r-th sub-sample replicate (r = 1,2,...,8)
- q = subscript for the q-th sub-round (q = 1,2,3 and 4)
- f = subscript for the f-th sampled village/ block as First Stage Unit (FSU)
- s = subscript for the s-th segment of sampled village/ block (s = 1 and 2)
- c = subscript for the c-th 2nd stage stratum of households in the sampled village/ block (c = 1,2)
- j = subscript for the j-th sampled household

- p = subscript for pooled estimate
 z = size used for selection of an FSU from the sampling frame
 Z = total of sizes in the sampling frame for the stratum
 [Note: For urban sector, z=1 and Z=N which is the total number of UFS blocks (FSU's) in the frame.]
 n = number of sampled FSU surveyed within a stratum and a sub-sample replicate (including zero cases but excluding casualty and not reported cases) and used for tabulation
 L = number of sub-sample replicates surveyed and used for tabulation
 D = number of hamlet-groups/ sub-blocks formed in rural/ urban sampled FSU
 H = total number of households listed in the appropriate frame
 h = number of sampled households surveyed and used for tabulation from the frame
 E = total number of enterprises listed in the appropriate frame
 e = number of sampled enterprises surveyed and used for tabulation from the frame
 y, x = value of characteristic y, x obtained in the sample
 \bar{Y}, \bar{X} = estimated value of aggregate of characteristic y, x obtained from the sample.

2.2.3 ESTIMATES OF AGGREGATE: In the formulae given in this section, \bar{Y} is the estimate of aggregate of any characteristic y for a given stratum (a), and for a particular sub-round (q) and sub-sample replicate (r). These formulae are provided for the general case of FSU's having two segments 1 and 2. For the FSU's requiring no hg/ sb formation, the formula is identical to that given for segment 1 while the contribution from segment 2 is taken as zero for estimating a characteristic of household from a given 2nd stage stratum (c) in the selection frame

$$\text{Rural : } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \frac{1}{z_f} \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad (1)$$

Here $B_{fsc} = \frac{H_{fsc}}{h_{fsc}}$, for segment 1 (s=1) and $B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}$, for segment 2 (s=2).

$$\text{Urban: } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad \dots(2)$$

Here $B_{fsc} = \frac{H_{fsc}}{h_{fsc}}$, for segment 1 (s=1) and $B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}$, for segment 2 (s=2).

Note: For tabulating any characteristic from this detailed schedule $\hat{Y} = \sum_c \hat{Y}_c$ is to be used.

2.2.3.1 COMBINED ESTIMATE FROM SUB-SAMPLES: In the previous section, the estimate of a characteristic \hat{Y} as obtained for a stratum (a), for a particular sub-round (q) and a sub-sample replicate (r), actually represent \hat{Y}_{aqr} . The combined /pooled estimate for a particular stratum and a particular sub-round is computed as the average of sub-sample replicate estimates and is given below:

$$\hat{Y}_{aq} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{aqr} \quad \dots(3)$$

2.2.3.2 ESTIMATE OF AGGREGATES FOR A SUB-ROUND AT STATE/ UT/ REGION LEVEL:

If \hat{Y}_{qr} be the State/ UT/ Region level aggregate from the r-th sub-sample replicate and q-th sub-round, and \hat{Y}_{qp} , the combined/ pooled estimate of the aggregate based on the whole sample, for a given sub-round q, then

$$\hat{Y}_{qr} = \sum_a \hat{Y}_{aqr} \quad \dots(4)$$

based on sub-sample replicate group r, and

$$\hat{Y}_{qp} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{qr} \quad \dots(5)$$

based on all sub-sample replicates.

2.2.3.3 ESTIMATES OF AGGREGATE FOR THE ROUND (i.e., taking all the 4 sub-rounds together) AT STATE/ UT/ REGION LEVEL:

The estimates of aggregates for the whole round are computed as the simple average of the sub-round estimates derived in section 2.2.2, and are given below:

$$\hat{Y}_r = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qr} \quad \dots(6)$$

based on sub-sample replicate1 and 2*and

$$\hat{Y}_p = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qp} \quad \dots(7)$$

based on whole sample.

***Note:** In the Round, sub-samples 1, 3, 5 and 7 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate1 (annual) while sub-samples 2, 4, 6 & 8 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 2 (annual). This has been followed in the remaining sections also. Stratum level estimate for the Round is obtained similarly.

2.2.4 ESTIMATES OF RATIO:

If \hat{X} and \hat{Y} be the State/ UT/ Region level aggregate estimate corresponding to variables x and y, then the estimate of ratio is given below:

$$\hat{R}_r = \frac{\hat{Y}_r}{\hat{X}_r} \quad \dots(8)$$

based on sub-sample group r, and

$$\hat{R}_p = \frac{\hat{Y}_p}{\hat{X}_p} \quad \dots(9)$$

based on the whole sample.

The formulae for \hat{X} are obtained similarly by replacing \hat{Y} by \hat{X} and y by x in the above formulae stated in previous sections.

Note: Estimates for the sub-round \hat{R}_{qr} and \hat{R}_{qp} have been obtained by replacing \hat{Y}_r and \hat{Y}_p by \hat{Y}_{qr} and \hat{Y}_{qp} , respectively and \hat{X}_r and \hat{X}_p by \hat{X}_{qr} and \hat{X}_{qp} , respectively.

Statement 0: Number of villages/ blocks allotted and surveyed and number of households and persons surveyed

State/UT	no. of villages		no. of blocks		no. of households surveyed		no. of persons surveyed

Section Three

Concepts and Definitions

3.0 The concepts and definitions followed in the sixth quinquennial survey on household consumer expenditure are more or less the same as in the earlier rounds. The concepts and definitions of the terms used or relevant in the report are given below:

3.1 Household: A group of persons normally living together and taking food from a common kitchen constitutes a household. The word ‘normally’ means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. ‘Living together’ is usually given more importance than ‘sharing food from a common kitchen’ in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say, in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc., is considered a single-member household except that a family living in a hotel (say) is considered to be one household only; the same applies to residential staff of such establishments.

3.2 Household size: The size of a household is the total number of persons in the household.

3.3 Household consumer expenditure: The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items, namely, (i) food, *pan* (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.4 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear is considered to be consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipts in exchange of goods and services; (d) any other receipt through gift, charity, borrowing; and (e) free collection. Home produce is evaluated at the ex farm or ex factory prices. For evaluating the consumption of the items of group (iii), i.e. items categorised as miscellaneous goods and services and durable goods, a different approach is followed. In this case, the expenditure

made during the reference period for the purchase of goods and services is considered to be consumption.

3.5 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests, whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan, advance, etc., made by the household are not considered consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item ‘cooked meals’ is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty in estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and of guests and employees are recorded in the purchaser household.

3.6 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept in mind while using the NSS consumer expenditure data for any nutritional studies relating to the nutritional status of households.

3.7 **Reference period:** Reference period means the period of time for which data on consumption was collected. The reference period used for the survey was a “moving” one, varying from household to household, although it was a fixed length of period. During 55th round of NSS, information on consumption of food, pan, tobacco & intoxicants was collected *independently* for two different reference periods of last 30 days and last 7 days from the same households. For items of clothing, footwear, durable goods, education and medical (institutional) expenses, data were collected for the reference period of “last 365 days” preceding the date of survey. For the remaining items, a reference period of “last 30 days” preceding the date of survey was used. However, the **monthly estimates presented in this report are based on data collected for “last 365 days” for clothing, footwear, durable goods, education and medical (institutional) expenses and for “last 30 days” for the rest of the items.** Here, it may be noted that the main results of 50th and other earlier quinquennial rounds were based on a reference period of 30 days only for all the items.

3.8 **Sector :** The word “sector” is used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.

3.9 Major states : This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.10 Monthly per capita consumer expenditure (MPCE): For a household, this is its last 30 days' total consumer expenditure divided by its size. A person's MPCE is understood as that of the household to which he or she belongs.

3.11 MPCE class: The MPCE classes are normally revised during quinquennial surveys of Consumer Expenditure. Usually, 12 MPCE classes are formed from a table giving estimated cumulative percentage frequency distribution of persons by MPCE for each sector separately and also combinedly. The upper limits of these classes correspond broadly to 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95% and 100% of the population. The class limits are given below:

sl. no.	rural (in Rs)	urban (in Rs)
1	0 – 225	0- 300
2	225 – 255	300 - 350
3	255 – 300	350 - 425
4	300 – 340	425- 500
5	340 – 380	500 - 575
6	380 – 420	575 - 665
7	420 – 470	665 - 775
8	470 – 525	775- 915
9	525 – 615	915 - 1120
10	615 – 775	1120 - 1500
11	775 – 950	1500 - 1925
12	950+	1925+

The MPCE classes have been assigned to the households on the basis of data with reference period of "365 days" for items of education, institutional medical expenses, clothing, footwear and durable goods and of "last 30 days" for the rest of the items.

3.12 Household type: Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household members. The five types of rural households are: *self-employed in non-agriculture*, *agricultural labour*, *other labour*, *self-employed in agriculture*, and *other households*. The four types of urban households are: *self-employed*, *regular wage / salary earner*, *casual labour*, and *other households*.

3.13 The “type” of a household was determined as follows.

Rural

A household was classified as “agricultural labour”, if its income during the last 365 days preceding the date of survey from that source was 50% or more of its total income. The same criterion was followed to classify a household as “self-employed in agriculture”. A household was classified as “self-employed in non-agriculture” if its income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as “other labour”. The remaining households were classified as “other households”.

Urban

A household was classified as “self-employed”, “regular wage or salary earning”, or “casual labour”, according to the major sources of its income from “gainful employment” during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under “others”.

3.14 **Social group:** Three social groups were distinguished - scheduled tribe, scheduled caste, and other households.

3.15 **Land possessed:** The area of land possessed (in hectares) includes land owned, land leased in, and (encroached) land neither owned nor leased in, but excludes land leased out. The size classes of land possessed are:

- < 0.01 ha
- 0.01– 0.40 ha
- 0.41-1.00 ha
- 1.01-2.00 ha
- 2.01-4.00 ha
- 4.01+

3.16 **Source of energy for cooking :** The source of energy used by a household during the last 30 days preceding the date of survey has been ascertained and collected in the survey. The type of sources are given below :

- coke, coal
- firewood and chips
- gobar gas
- dung cake
- charcoal
- kerosene
- electricity
- others

If a household used more than one of the above sources then the one having major use has been assigned to the household. The term used for this source is *primary* source of energy for cooking.

3.17 Source of energy for lighting: Like source of energy for cooking the source of energy used by households during the last 30 days preceding the date of survey has been ascertained and collected in the survey. The different types of sources are given below:

- (i) kerosene
- (ii) other oil
- (iii) gas
- (iv) candle
- (v) electricity
- (vi) others

If a household used more than one of the above sources then the one having major use has been assigned to the household. The term used for this source is primary source of energy for lighting.

3.18 The report gives information on the *primary* source of energy separately for cooking and lighting used by the households. It ignores the sources other than the *primary* sources used by the households.

Section Four

Survey Findings

4.0 In this section, some general findings relating to primary source of energy used for cooking and lighting based on data collected in the sixth quinquennial survey on Household Consumer Expenditure conducted during NSS 55th round (July 1999 - June 2000) are presented. The results have been compared with those of the previous quinquennial survey (NSS 50th round, July 1993 – June 1994).

This report gives distribution of households by source of energy used for cooking or lighting for households in different socio-economic categories. The entries relating to all households may not match with those in NSS Report no. 457 as these are exclusive of ‘not recorded cases’.

4.1 Primary Source of energy for cooking

4.1.1 **Inter-State and temporal variation** At the outset, the proportion of households using different sources of energy for cooking in different States (restricted to major States) are compared for NSS 50th and 55th rounds. Statements 1R and 1U give per 1000 distribution of households by primary source of energy for cooking used by the households, separately for rural and urban areas. In these statements, all the sources for which data were collected have not been considered. Only those sources having significant use are included. The rest have been included under ‘others’. (This “others” is different from “others” in the appendix tables.) The statements reveal the following facts:

In the **rural areas** of the country, the households used mainly three primary sources of energy for cooking, viz., firewood and chips, dung cake and LPG. Among the different sources, firewood and chips was used by almost three-fourths of the rural households. However, there was a decreasing trend in the percentage of households using firewood and chips over the period 1993-2000: the percentage decreased by 3 points over 1993-2000. The pattern of use of firewood and chips for cooking was similar for all the major States barring Punjab (35%) and Haryana (49%). But in both these States, the use of dung cake for cooking was relatively common. Besides these two States, the other major States where dung cake often used were Uttar Pradesh (33% of households) and Bihar (24%). The use of LPG was relatively common in four States, viz., Haryana (18% of households), Punjab (14%), Kerala (12%) and Gujarat (10%) and relatively uncommon (less than 2% of households) in Bihar, Madhya Pradesh, Orissa and West Bengal. However, the use of LPG increased by 3 percentage points during 1993-2000 at all-India level and the use of dung cake decreased slightly.

Figure 1R: Distribution of households by primary source of energy used for cooking - rural India

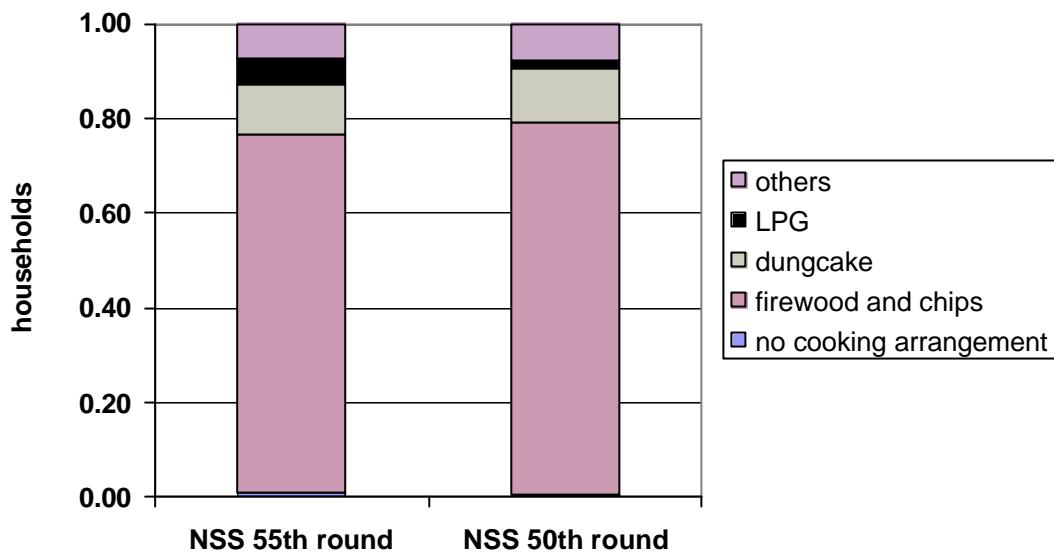

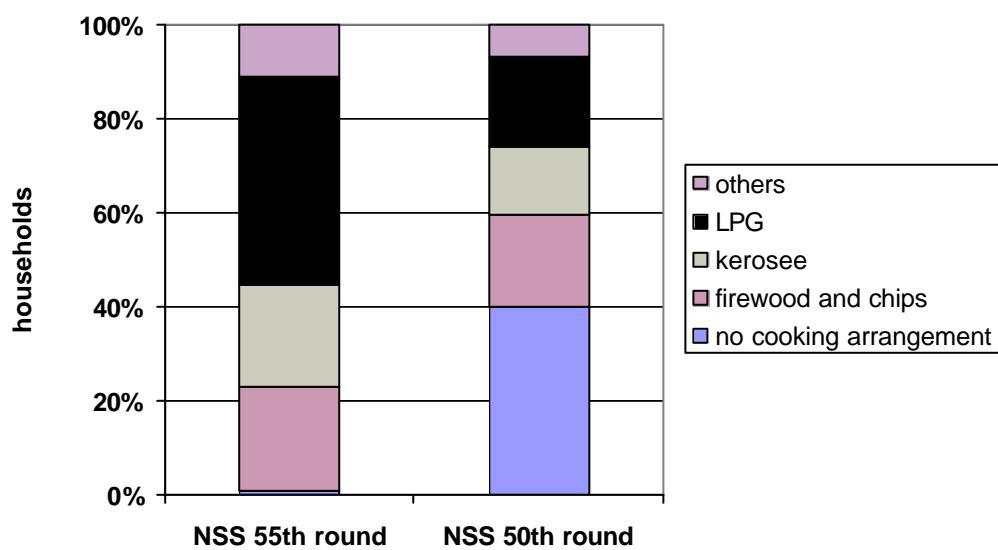

Figure 1U: Distribution of households by primary source of energy used for cooking - urban India

Statement 1R: Per 1000 distribution of households by primary source of energy used for cooking for each major State

All-India state	55-th Round (July 1999 – June 2000)						50-th Round (July 1993 – June 1994)						Rural
	no cooking arrange- ment	firewood and chips	dung cake	LPG	others	all	no cooking arrange- ment	firewood and chips	dung cake	LPG	others	all	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
Andhra Pradesh	31	871	3	63	32	1000	6	938	6	23	27	1000	
Assam	2	934	2	56	6	1000	0	973	5	11	11	1000	
Bihar	2	634	242	6	116	1000	3	634	256	3	104	1000	
Gujarat	16	776	22	102	84	1000	5	788	65	49	93	1000	
Haryana	0	494	303	184	19	1000	1	683	247	36	33	1000	
Karnataka	22	869	1	43	65	1000	10	940	3	17	30	1000	
Kerala	9	847	3	116	25	1000	14	921	2	41	22	1000	
Madhya Pradesh	5	927	26	17	25	1000	3	912	62	5	18	1000	
Maharashtra	29	702	9	91	169	1000	9	767	13	35	176	1000	
Orissa	13	894	55	8	30	1000	21	889	39	3	48	1000	
Punjab	2	349	375	142	132	1000	6	507	340	51	96	1000	
Rajasthan	5	930	18	29	18	1000	2	900	44	20	34	1000	
Tamil Nadu	14	859	1	67	59	1000	13	913	1	31	42	1000	
Uttar Pradesh	3	573	329	36	59	1000	4	627	329	12	28	1000	
West Bengal	4	785	54	17	140	1000	11	613	88	3	285	1000	
all-India	11	755	106	54	74	1000	7	782	115	19	77	1000	

In **urban areas** of the country, the households used mainly three primary sources, viz., firewood and chips, kerosene and LPG as primary source of energy for their cooking. Around 22% of urban households used firewood and chips. The percentage of households using firewood and chips decreased over 1993-2000 by about 8 percentage points. Of these sources, LPG was predominant. The use of LPG is increasing over time. Only 30% households were using LPG as primary source of energy for cooking in 1993-94 while 44% used it in 1999-2000. Use of kerosene decreased marginally over 1993-2000 by 1 percentage point.

4.1.2 Variation by MPCE: Statement 2 presents distribution of households by MPCE class for each primary source of energy used for cooking at all-India level. For reading this statement one has to compare the entries of columns (2) to (11) with the entries in column (12) to judge whether the frequency of use is relatively high or not. It brings out that the rural people belonging to lower MPCE classes used more firewood & chips and dung cake. However, the people belonging to top MPCE classes used more LPG and kerosene in rural areas and LPG in urban areas. The average MPCE given in the bottom rows corroborates this fact. In other words, the average MPCE for the households using LPG and kerosene in rural areas and LPG in urban areas was much higher than that for households that

used any other source for cooking. The urban households belonging to lower MPCE classes had higher proportions of households not having any cooking arrangement. The rural households belonging to top and bottom MPCE classes showed a very high proportion of households who did not have any cooking arrangement. The average MPCE for the households which did not have any cooking arrangement was relatively high in rural areas and relatively low in urban areas.

Statement 1U: Per 1000 distribution of households by primary source of energy used for cooking for each major State

State	55-th Round (July 1999 – June 2000)						50-th Round (July 1993 – June 1994)						Urban
	no cooking arrangement	firewood and chips	kerosene	LPG	others	all	no cooking arrangement	firewood and chips	kerosene	LPG	others	all	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)		
Andhra Pradesh	3	271	216	438	72	1000	27	441	211	279	42	1000	
Assam	1	341	111	500	47	1000	45	441	155	345	14	1000

Kerala	3	541	68	310	78	1000	73	703	52	168	4	1000	
Madhya Pradesh	1	346	179	377	97	1000	30	414	156	308	92	1000	
Maharashtra	11	97	304	515	73	1000	74	138	376	389	23	1000	
Orissa	2	432	224	169	173	1000	99	424	120	180	177	1000	
Punjab	4	113	310	480	93	1000	11	145	359	409	76	1000	
Rajasthan	0	312	144	509	35	1000	24	391	243	285	57	1000	
Tamil Nadu	1	233	329	372	65	1000	115	430	250	192	13	1000	
Uttar Pradesh	4	305	141	431	119	1000	21	391	148	315	125	1000	
West Bengal	40	121	192	347	300	1000	106	84	140	187	483	1000	
all-India	7	223	217	442	111	1000	63	300	232	296	109	1000	

4.1.3 Variation by household type: Statements 3R and 3U show the distributions of households by primary source of energy used for cooking separately for each household type. From Statement 3R, it is observed that the percentage of households using firewood and chips was the highest for agricultural labour households among the different household types in rural India. The use of dung cake was more common among the households classified as self-employed in agriculture. Though the overall percentage of households using gobar gas was less than 1% and the percentages for different household types are not quite visible, this percentage appears to be the highest among self-employed in agriculture households. The occupational variation in use of energy in urban areas is given in Statement 3U. It

depicts that the proportion of households in urban India using LPG for their cooking was the highest for regular wage/salary earners compared to other categories of households. For firewood and chips, the percentage was the highest for casual labour households: it was 53% as against the national average of 22%. The use of kerosene for cooking was also highest (29%) for the casual labour households.

Statement 2: Per 1000 distribution of households by MPCE class and average MPCE, separately for each primary source of energy used for cooking

4.1.4: Variation by social group: Statement 4 gives variation in use of different primary source of energy used for cooking across different social groups in both rural and urban areas at all-India level. Firewood and chips was used by more than 90% of households belonging to scheduled tribes in rural areas. This is mainly because they normally live in places from where forests are accessible. For dung cake, the percentages of households belonging to scheduled castes (13%) and other backward classes (13%) were higher than that for scheduled tribes (2%).

Statement 3U: Per 1000 distribution of households by primary source of energy used for cooking for each household type

household type	primary source of energy used for cooking											Urban
	coke, coal	firewood and chips	LPG	gobar gas	dung cake	char- coal	kero- sene	electri- city	others	no cooking arrange- ment	all	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)
self-employed	46	261	449	0	31	2	189	2	8	13	1000	
regular wage/salary earning	40	101	564	1	9	1	234	7	5	39	1000	
casual labour	40	532	84	0	32	1	285	1	12	13	1000	
others	30	155	424	1	16	2	155	2	7	208	1000	
not recorded	100	330	398	12	28	0	111	0	11	10	1000	
all	41	223	442	1	21	1	217	4	7	43	1000	

In urban India, the use of firewood and chips was more common among ST, SC and OBC households and much less common for ‘others’. This last group used LPG in a much greater percentage of cases than the three earlier mentioned groups.

Statement 4: Per 1000 distribution of households by primary source of energy used for cooking for each social group

social group	primary source of energy for cooking											All-India

4.2 Primary Source of energy for lighting:

4.2.1 Inter-State and temporal variation The different primary sources of energy used for lighting by the households in India are kerosene, gas, candle, electricity, other oil, etc. Among these, only kerosene and electricity are more common. At national level, these two accounted for 99% of the households in both rural and urban areas. The frequencies of use of these two sources in different major States and all-India are given in Statement 5 for NSS 55th and 50th rounds, separately for rural and urban areas. It is seen that the use of electricity in **rural** areas was the highest in Punjab (93% of households) followed by Haryana (82%) and Gujarat (79%). The percentage of households using electricity was the lowest in Bihar (only 6%), Orissa (18%), West Bengal (21%), Uttar Pradesh (24%) and Assam (25%). The proportions of household using kerosene and electricity are complementary to each other and therefore moved in opposite directions across the States. This was also true for **urban** areas of the major States. However, the percentage of households using electricity was high in urban areas of all the major States: It was above 90% in 9 out of 15 major States. At all-India level, 89% urban households used electricity. The percentage was less than 70% for only Bihar and Orissa.

Comparing results from NSS rounds 50 and 55, it is seen from Statement 5 as well as Figures 2R and 2U that the percentage of households using kerosene decreased and that for electricity increased in both rural and urban areas between the years 1993-94 and 1999-2000. Obviously, this was due to increase in electrification over the period which lessened the dependence on kerosene.

Figure 2R: Distribution of households by primary source of energy used for lighting - rural India

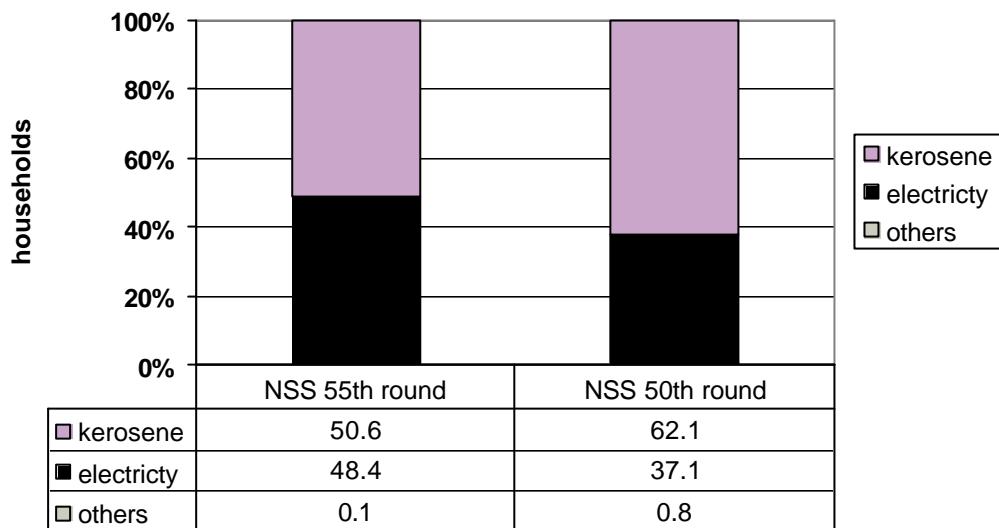

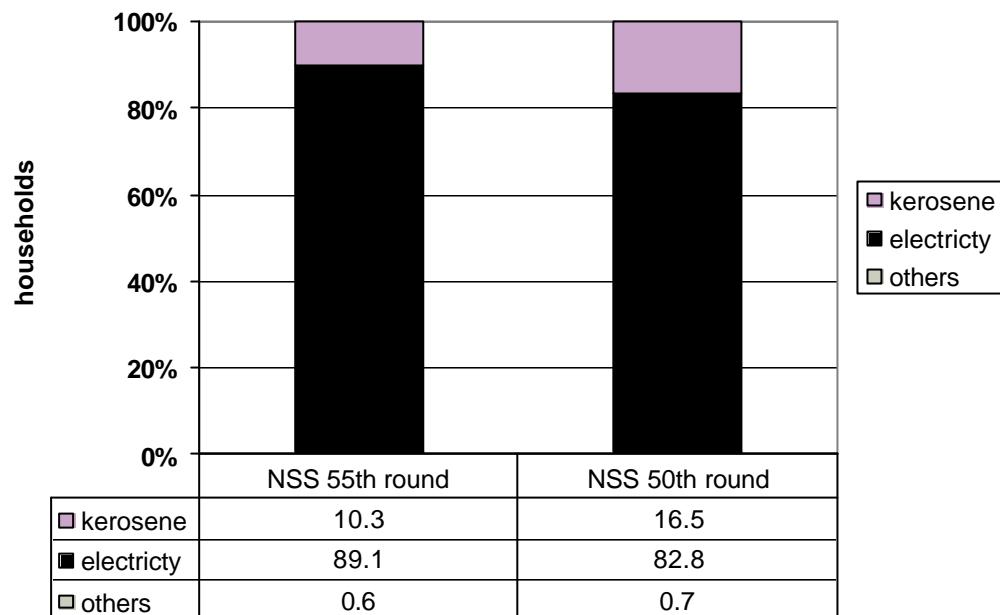

Figure 2U: Distribution of households by primary source of energy used for lighting - urban India

Statement 5: Per 1000 distribution of households by primary source of energy used for lighting for each major State

4.2.2 Variation by MPCE: Statement 6 presents distribution of households by MPCE class for each important primary source of energy used for lighting. Comparing the columns for kerosene and electricity with the last column one can see that the households in lower MPCE brackets used kerosene more frequently than electricity for their lighting in both rural and urban areas. For the households in the upper MPCE brackets, it was just the opposite. In both the sectors, the average MPCE was relatively low for kerosene-user and relatively high for electricity-user.

Statement 6: Per 1000 distribution of households by MPCE class and average MPCE, separately for each primary source of energy used for lighting

MPCE class (Rs)	primary source of energy for lighting

4.2.3 Variation by household type: Statements 7R and 7U present the distribution of households by primary source of energy used for lighting in rural and urban areas, respectively, at all-India level. The relative frequency of use of electricity and kerosene in rural households, when classified by household type, was more or less equal for self-employed in non-agriculture, other labour and self-employed in agriculture and the use of electricity was relatively less frequent for agricultural labour.

Among the urban households, the percentage of households using electricity for lighting was the highest for regular salary/wage earning households and the lowest for casual labour households.

Statement 7R: Per 1000 distribution of households by primary source of energy used for lighting for each household type

All-India household type	primary source of energy used for lighting	Rural

	no lighting arrangement	kerosene	other oil	gas	candle	electricity	others	all
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
self-employed in non-agriculture	4	477	2	1	1	513	1	1000
agricultural labour	6	605	2	1	1	384	1	1000
other labour	5	456	2	1	0	535	1	1000
self-employed in agriculture	3	489	3	1	1	502	1	1000
Others	6	339	3	0	1	651	1	1000
not recorded	0	687	0	0	0	313	0	1000
all	5	506	2	1	1	484	1	1000

Statement 7U: Per 1000 distribution of households by primary source of energy used for lighting for each household type

all	3	103	1	1	0	891	1	1000	

4.2.4: Variation by social group: Statement 8 shows the variation in use of primary source of energy for lighting across different social groups in rural and urban areas. It shows that in both rural and urban areas, kerosene was used by the highest percentage of households of scheduled tribe, followed by scheduled caste, and then by other backward class and ‘others’. The use of electricity by different social groups followed the opposite pattern. Note that the percentage for ST and SC households are fairly close while those for the other groups are appreciably lower.

Statement 8: Per 1000 distribution of households by primary source of energy used for lighting for each social group

social group	primary source of energy for lighting								All-India
	no lighting arrangement	kerosene	other oil	gas	candle	electricity	others	all
