

# **Common Property Resources in India**

**NSS 54th Round  
January 1998 – June 1998**

**National Sample Survey Organisation  
Department of Statistics and Programme Implementation  
Government of India**

December 1999

## **PREFACE**

*An enquiry on common property resources (CPRs) was conducted as a part of the 54th Round of the National Sample Survey Organisation (NSSO) during January to June 1998. The enquiry was carried out only in the rural areas of the country.*

*Common property resources constitute all such resources which are meant for common use of the villagers. In the pre-British India, a very large part of the country's natural resources was freely available to the rural population. These resources were largely under the control of the local communities. Gradually, with the extension of state control over these resources, resulting in decay of the community management system, CPRs available to the villagers declined substantially over the years. Nevertheless, it is widely held that CPRs still play an important role in the life and economy of the rural population. The beginning of the studies of the CPRs in India can be traced back to early 1980's. Some of these studies covered fairly a large number of villages scattered over the vast area of the country but majority of those was of the nature of case studies.*

*The enquiry, therefore, is the first attempt to provide comprehensive state- and national- level estimates of size, utilisation and contribution of CPRs. It also provides separate estimates for different agro-climatic zones of the country.*

*The present report relates to CPRs in the life and economy of rural population. There are four chapters and three appendices. Chapter I presents a brief introduction to the perspective of the report. Chapter II provides a discussion on the definitions and concepts used for the enquiry. Chapter III gives a fairly detailed description of the sample design and the estimation procedure used for the survey. Chapter IV discusses the summary results of the survey and attempts to provide a perspective for proper interpretation of the results. Appendix I, which in fact, forms the main body of the report, presents the detailed survey results on common property resources in the form of tables. Appendix II gives the details of the composition of agro-climatic zones used for tabulation of the results of the survey. A brief note on the editing and imputation procedure adopted for the survey data of the present enquiry is given in Appendix III.*

*The field work of the survey was conducted by the Field Operations Division. Data scrutiny and tabulation were handled by Data Processing Division. The Survey Design & Research Division was responsible for designing of the survey and preparation of the report.*

*I am grateful to the members of the Governing Council and member of the Working Group for their valuable guidance at various stages of the survey work. I also wish to thank the heads of various divisions of NSSO and their colleagues for their efforts in conducting the survey and bringing out this report. It is hoped that this report would serve as reference document to the users of NSS data.*

*Comments and suggestions for the improvement of the report are most welcome.*

*December 1999*

*Dr. N. S. SASTRY*

*Director General & Chief Executive Officer  
National Sample Survey Organisation*

## List of Appendix tables

Table no.	Title	Page no.
1.1	CPR land (ha) per household by type of land and percentages of CPR land to total geographical area and to total non-residential geographical area in different climatic zones	A-1
1.2	Common village land (ha) per household by population size-class of villages in different states	A-3
1.3	Per 1000 distribution of households by population size-class of villages in different states	A-4
2.	Per 1000 distribution of households by availability of common village land per household	A-5
3.1	Reduction in common village land diminished during last 5 years per 1000 hectares of common village land 5 years ago by present availability of common village land per household	A-7
3.2	Reduction in common village land diminished during last 5 years per 1000 hectares of common village land 5 years ago by size-class of village	A-9
4.	Per 1000 distribution of households by access to forest within or outside the village	A-10
5.	Per 1000 distribution of households by extent of use of common village land for collection of different materials and climatic zones	A-12
6.	Per 1000 distribution of households with forest within or outside the village of their residence by prevalence of collections of different types of forest produce	A-23
7.1.	Number (per 1000) of households residing in villages with common potable water resources (CPWR) for each climatic zone	A-34
7.2.	Number (per 1000) of households residing in villages with common potable water resources (CPWR) for each population (census '91) size-class of villages	A-36
8.	Per 1000 distribution of households by availability of community and government water resources in villages of their residence and presence of local management of common water sources for irrigation for each climatic zone	A-43
9.1.	Per 1000 distribution of households by purpose of fuel wood use for each climatic zone	A-45
9.2.	Per 1000 distribution of households by purpose of fuel wood use for population (census 1991) in each size class of villages	A-47
10.1.	Number (per 1000) of households using fuel wood by category of household for each climatic zone	A-54
10.2.	Number (per 1000) of households using fuel wood by category of households for population of each size-class of villages	A-56
11.1.	Number (per 1000) of households reporting <i>collection</i> of fuel wood from CPR by category of household for population of each climatic zone	A-64
11.2.	Number (per 1000) of households reporting <i>collection</i> of fuel wood from CPR by category of household for each size class of village.	A-66

contd.

12.1.	Per 1000 number of households reporting sale of fuel wood collected from CPR per 1000 households by household type for each climatic zone	A-73
12.2.	Per 1000 number of households reporting sale of fuel wood collected from CPR per 1000 households by household type for each size class of villages	A-75
13.1.	Average quantity and value of collection and sale of fuel wood collected from CPR during last 365 days	A-82
13.2.	Average quantity and value of collection and sale of fuel wood collected from CPR during last 30 days	A-89
14.1.	Per 1000 distribution of quantity of fuel wood <i>collected</i> from CPR during last 365 days by source	A-96
14.2.	Per 1000 distribution of quantity of fuel wood <i>collected</i> from CPR during last 30 days by source	A-97
15.1.	Per 1000 distribution of households by availability of CPR land and forest for each climatic zone	A-98
15.2.	Number (per 1000) of households reporting use of fuel wood and collection of fuel wood from CPR by availability of CPR land and forest for each climatic zone	A-100
16.1	Number (per 1000) of households reporting use of CPR for (i) collection and (ii) cultivation of fodder separately for households possessing and not possessing livestock and climatic zone	A-104
16.2.	Number (per 1000) of households reporting use of CPR for (i) collection and (ii) cultivation of fodder separately for households possessing and not possessing livestock and population of size-class of villages	A-109
17.1.	Number (per 1000) of households reporting grazing of livestock on different types of CPR land and forest and reporting possession of livestock for each climatic zone	A-122
17.2.	Number of households (per 1000) reporting grazing of livestock on different types of CPR land and forest and reporting possession of livestock for population of size-class of villages	A-124
18.1.	Per 1000 distribution of households by category of households for households with and without livestock and those not possessing livestock and each climatic zone	A-131
18.2.	Number per 1000 of households reporting <i>collection</i> of fodder from CPR by household type for each climatic zone	A-137
18.3.	Number per 1000 of households reporting <i>sale</i> of fodder collected from CPR by household type for each climatic zone	A-143
19.1.	Average quantity (Qts.) and value (Rs.) of collection and sale of fodder collected from CPR during last 365 days by category of households	A-149
19.2.	Average quantity (Qts.) and value (Rs.) of collection and sale of fodder collected from CPR during last 30 days by category of households	A-156
20.	Per 1000 distribution of quantity of fodder <i>collected</i> from CPR during last 365 days by source	A-163
21.	Number (per 1000) of households reporting (i) possession of livestock and (ii) collection of fodder from CPR by availability of CPR land and forest	A-170
22.1.	Number (per 1000) of households reporting collection of some selected materials from CPR for each climatic zone	contd. A-174

22.2.	Number (per 1000) of households reporting collection of some selected materials from CPR by category of households	A-176
23.1.	Total value(Rs.) of collections of selected materials from CPR during 365days per household by household type for each state and u.t.	A-183
23.2.	Per 1000 distribution of value of collections of selected materials from CPR during last 365 days by type of material for each climatic zone	A-184
24.1.	Per 1000 distribution of value of collections of selected materials from CPR during last 365 days by type of material for each State and u.t.	A-185
24.2.	Per 1000 distribution of value of collections of selected materials from CPR during last 365 days by type of material for each climatic zone	A-186
25.1.	Number (per 1000) of households reporting use of other community resources by purpose of use for each climatic zone	A-187
25.2.	Number (per 1000) of households reporting use of community resources by purpose of use and category of households	A-189
26.1.	: Number ( per 1000) of households reporting use of water resources under different agencies for irrigation for each climatic zone	A-196
26.2.	er 1000) of households reporting use of water resources under different agencies for irrigation for each category of households	A-198
27.1.	Number (per 1000) of households reporting use of common water resources for irrigation residing in villages with different ownership type of water resources by presence of local management of common water resources for irrigation	A-205
27.2.	Number (per 1000) of households reporting use of common water resources for irrigation by residence in villages with different ownership type of water resources and presence of local management of common water resources for irrigation	A-207

## Highlights

<b>(a) Common Property Land Resources (CPLR)</b>		
• Percentage of Common Property Land Resources in total geographical area		15 %
• Common Property Land Resources per household (ha.)		0.31
• Common Property Land Resources per- capita (ha.)		0.06
• Components of Common Property Land Resources		
Community Pastures and grazing land		23 %
Village Forest and woodlots		16 %
Other		61 %
• Reduction in CPR land during last 5 years (per 1000 ha.)		19 ha
<b>(b) Collections from CPLR</b>		
• Households reporting collection of any materials from CPRs.		48 %
• Average Value of annual collections per household		Rs 693
• Ratio of average value of collection to average value of consumption expenditure.		3.02 %
<b>(c) Nature of use of CPRs</b>		
• Households reporting grazing of livestock on CPRs.		20 %
• Households reporting use of common water resources.		
irrigation		23 %
livestock rearing		30 %
household enterprise		2.8 %
• Share of fuelwood in value of collection from CPRs.		58 %
• Percentage of households reporting use of fuelwood		52 %
• Households reporting collection of fuelwood from CPRs.		45 %
• Average quantity of fuelwood collected from CPRs during 365 days.		500 kg
• Households possessing livestock		56 %
• Households collecting fodder from CPRs.		13 %
• Households cultivating fodder on CPRs.		2 %
• Average quantity of fodder collected from CPRs during 365 days.		275 kg
• Households reporting irrigation using Common Property Water Resources owned/ managed by:		
Village Panchayat		1.1 %
Community		0.8 %
Government		1.8 %
River / Govt. Canal etc.		10.3 %

## The list of Agro-climatic Zone

(defined by Planning Commission)

zone	abbreviations
1. Western Himalays	WHm
2. Eastern Himalayas (include N .E Hills) and Bramhaputra Valley	EHm
3. Lower Gangetic Plains	LG
4. Middle Gangetic Plains	MG
5. Trans-Gangetic Plains	TG
6. Upper Gangetic Plain	UG
7. Central Plateau and Hills	CHg
8. Eastern Plateau and Hills	Ehg
9. Western Plateau and Hills	Whg
10. Southern Plateau and Hills	DP
11. East Coast Plains and Hills	EG
12. West Coast Plains and Hills	WC
13. Gujarat Coast Plains and Hills	GC
14. Western Dry Region	TD
15. All Islands	Islands

# **Chapter I**

## **Introduction**

### **1.1 The Report in Perspective**

1.1.1 An enquiry on common property resources (CPRs) was conducted during January to June 1998 as a part of the 54<sup>th</sup> round survey of the National Sample Survey Organisation (NSSO). The enquiry was carried out in the rural areas of the entire country through a household survey based on random sampling. Some village- level data on the extent of CPRs available to the villagers were also collected in the survey. Since early 1980s, a large number of field studies on CPRs, of varying scale, have been conducted, particularly in the arid and semi-arid areas or hill and forest fringe regions of the country. The present enquiry is the first attempt to provide comprehensive state and national-level estimates of size, utilisation and contribution of CPRs. It also provides separate estimates for agro-climatic zones.

1.1.2 *Objective:* Broadly speaking, common property resources include all such resources that are meant for common use of the villagers. CPRs include all resources like village pastures and grazing grounds, village forest and woodlots, protected and unclassed government forests, waste land, common threshing grounds, watershed drainage, ponds and tanks, rivers, rivulets, water reservoirs, canals and irrigation channels. In the pre British India, a very large part of the country's natural resources was freely available to the rural population. These resources were largely under the control of local communities. Gradually, with the extension of state control over these resources and the resultant decay of community management system, CPRs available to the villagers declined substantially over the years. Today, in almost all parts of the country, the villagers have a legal right of access only on some specific categories of land and water resources. Nevertheless, it is widely held that CPRs still play an important role in the life and economy of the rural population. The present enquiry aims at providing certain basic statistics on the size of CPRs, type of benefits derived from CPRs, their magnitude and the proportion of households making use of CPRs.

### **1.2 The Present Report**

1.2.1 This report pertains mainly to the role of CPRs in the life and economy of the rural population and is based on data collected on the area of common property land resources, collection of different items such as fuelwood, fodder, weeds, canes, bamboo, manure and variety of edibles from the CPRs and use of CPRs for grazing and irrigation, in the 54th round of NSSO. Data collected and used in this report can be briefly described as follows:

1. Area of common property resources in the surveyed village by type.

2. Availability and use of different types of CPR land and forest.
3. Value and quantity of fuelwood, fodder, and other items collected from CPRs by the surveyed households.
4. Availability and use of irrigation water from CPRs.

1.2.2 *Layout of the report:* The report contains four chapters, including the present one, and three appendices. Chapter II provides a brief discussion on the definitions and concepts used for the enquiry. Chapter III gives a fairly detailed description of the sample design and the estimation procedure used for the survey. Chapter IV discusses the summary results of the survey and attempts to provide a perspective for proper interpretation of the results. Appendix I, which in fact, forms the main body of the report, presents the detailed survey results on common property resources in the form of tables. Appendix II gives the details of the composition of agro-climatic zones used for tabulation of the results of the survey. A brief note on the editing and imputation procedure adopted for the survey data of the present enquiry is given in Appendix III.

1.2.3 The estimates presented in the report are based on the pooled data of the two *sub-samples* of only the *Central sample*. (See the section “Method of Data Collection” for discussion on *sub-sample* and *Central sample*.) The survey results presented in the report are mostly in the form of ratios. The basic aggregate estimates and number of households, given in the detailed tables of the Appendix, generally as marginal column totals, may be used for working out rates and ratios for domains not presented in the report.

### **1.3 Fifty-fourth round**

1.3.1 The four main topics covered in the 54th round are:

- (i) Drinking Water, Sanitation & Hygiene
- (ii) Travel and Use of Mass Media and Financial Services
- (iii) Cultivation Practices
- (iv) Common Property Resources

In addition, the topics of household consumer expenditure and employment-unemployment were covered as usual with every round. The present report contains the survey results of the enquiry on CPRs. The results of the enquiries on other topics are brought out in separate reports.

1.3.2 The main schedules used in the 54th round, apart from Schedule 1.0 on consumer expenditure, were: Schedule 3.3 on village facilities and common property resources; and Schedule 31 on Drinking Water, Sanitation and Hygiene, Travel and Use of Mass Media and Financial Services, Cultivation Practices and Common Property Resources.

1.3.3 For the enquiry on common property resources, the rural areas of the entire country were covered with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands and the Ladakh and Kargil districts of Jammu & Kashmir.

#### **1.4 Method of data collection**

1.4.1 The present report is based mainly on the information on the size of common property land resources collected in Schedule 31 and data on use of CPRs and benefits accruing from them. . The data were collected from a sample of households by interview method. The survey period for the 54th round was January to June 1998.

1.4.2 *Reference period:* The enquiry on CPRs was conducted with four different reference periods. First, all data pertaining to area of CPR land were collected with the data of survey as reference point. Next, the data on reduction of CPR land relate to period of preceding five years. For the data on use and availability of CPRs, the period of preceding 365 days was generally taken as the reference period. Lastly, for the data on collection of fuelwood and fodder from the CPRs, two different reference periods, viz. ‘preceding 30 days’ and ‘preceding 365 days’ were used.

1.4.3 *Sample design:* The sample design adopted for the survey was essentially a two-stage stratified design, with census villages and urban blocks as the first-stage units (FSUs) for the rural and urban areas respectively, and households as the second-stage units (SSUs). The survey period was January - June 1998. The rural and urban sample FSUs were drawn independently in the form of two sub-samples and an equal number of FSUs was allocated to each sub-sample. (For a detailed discussion on sample design, see Chapter III.)

1.4.4 *Sample size - first stage units:* In all, 10,978 villages were planned to be surveyed in this round. Of these, 5242 were allocated to the Central sample - the part surveyed mainly by the NSSO field staff - and the rest to the State sample - the part surveyed by the State agencies. In the urban sector, the allocations for the Central and State samples were respectively 1788 and 2256 blocks. This report, however, pertains to rural areas and is based on the data collected from the villages in the Central sample alone.

1.4.5 *Sample size - second stage units:* For Schedule 31, 16 households were planned to be surveyed in each selected village and 18 households in each selected UFS blocks. In all, 78,990 rural households were surveyed in the present survey.

## Chapter II

### Concept and Definition

2.1 *Household*: A group of persons normally living together and taking food from a common kitchen constitute a household. The word ‘normally’ means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in hostel for studies is excluded from household of his\her parents, but a resident employee or resident servant or paying guest (but just not a tenant in the house) is included in the employer\host’s household. ‘Living together’ is usually given more importance than ‘sharing food from a common kitchen’ in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of person taking food with his family but sleeping elsewhere (say, in shop or a different house) due to space shortage, the household formed by such a person’s family members is taken to include the person also. Each inmate of a mess, hotel, boarding house, etc. is considered as single member household but a family living in a hotel is considered to be one household only; the same applies to residential staff of such establishments.

2.2.1 *Common property resources* (CPRs): Resources accessible to and collectively owned\held\managed by an identifiable community and on which no individual has exclusive property rights are called common property resources. Terms like “accessible”, “collectively owned/held/managed”, “identifiable community” and “exclusive property rights” are explained briefly below:

2.2.2 *Accessible*: Accessibility to a resource is determined either by legal status or by convention. If the community has a legal right of ownership or possession on the resource, it is clearly accessible to the community. Besides such legal rights, resources for which customarily accepted user rights exist are also treated as “accessible” to the community.

2.2.3 *Collectively owned/held/managed*: Both (a) collectively owned/held resources and (b) collectively managed though not collectively owned/held resources are considered as “Collectively owned/held/managed”. The term “Collectively owned or held” presumes a legal status. Thus, a resource collectively owned or formally held (by legal sanction or official assignment) by a community is considered to be a common property resource. A resource nominally held by a community is treated as “collectively managed” only when the groups of people who have the right to its use are governed by a commonly accepted set of rules -- in most cases unwritten.

2.2.4 *Identifiable community*: This means that co-users of the resources are a well-defined group of persons. For instance, all inhabitants of a village form an identifiable community. A

large census village usually comprises a number of distinct settlements. The residents of one or more such settlements, constituting only a part of the village's population, can also form a community. Apart from these, a community may be a caste-based or religion-based or occupation-based group of people or a group constituted according to the traditional social order.

**2.2.5 Exclusive property rights of an individual:** Resources owned or held by an individual or a family or an organisation like a company or corporation or co-operative are not be considered as CPRs. However, a resource held by a co-operative society constituted of persons who were co-users of the resource prior to its formation, is treated as a CPR. For example, all resources of co-operative societies of co-users, such as co-operative irrigation societies, farmers' co-operatives, fishermen's co-operatives, etc. are considered as CPR for this survey. Also note that private property resources (PPRs) can be pooled and used as a common resource. In such cases pooled resources were treated as CPR for this survey.

**2.3.1 Common village land or 'commons':** These categories of CPRs refer to common property land resources within the boundary of the village and were formally (i.e. by legal sanction or official assignment) held by village *panchayat* or community of the village. Categories of common village land are described below:

- **Village panchayat grazing land/pasture land:** This is a well-defined category of land in the classification used in official land-use records. Traditionally, grazing and pasture land has been the most important constituents of CPR land. Many villages have land earmarked as permanent pasture land/grazing land. These are variously known as *gauchar*, *gochar*, *gairan*, *gomol*, etc. Villagers have user right on permanent pasture by legal sanction. Village woodlots which may have come up on the grazing land/pasture land were not considered under this category.
- **Village forest & woodlot (not under Forest/Revenue Deptt.) and van panchayat forest:** This item includes all land under village forest and woodlots. This also includes the area notified as forest within the village which may belong to the forest department, or any other government department (like Revenue deptt. or PWD.) but is formally under the management of village panchayat or a community of the village. *Van panchayat* forests in the hills of Uttar Pradesh, which are formally managed by village communities, are also included in this category
- **Village sites and threshing floor:** They include village sites and all area of land which is earmarked for common use of the villagers for economic activities, such as (a) processing of agricultural produce , (b) storing of grains, other agricultural produce, firewood, etc., (c) use for other household enterprise.

**2.4.1 Government forest:** By legal status, forests in India are classified into following three categories, viz. Reserved forest, Protected forest, and Unclassified forests. Forest land also includes all state owned area of land classed as forest under any legal enactment or administered as forest, whether or not actually under forest. However, area of land under social and farm forestry, village forests, *Van Panchayat* forests and forests owned by individual households are excluded. The category of forests so formed is referred to as Government forests in this report.

- *Reserved forest:* Reserved forests are constituted under the Indian Forest Act or other forest laws of the States. The government holds absolute rights of ownership in reserved forests. The products of a reserved forest are not to be used by the local population unless specifically permitted by way of grant of privilege and not as a matter of right. Access to these forests is generally restricted. For this survey, all forests declared as wild life or game sanctuary or national parks were treated reserved forests.
- *Protected forest:* Protected forests too are constituted under the Forest Act. The locals are permitted to gather all produce except those items which are specifically prohibited. Other privileges to the local population are also permitted. The privileges commonly enjoyed by the local population include collection of leaves, firewood, fodder and other minor forest produce, grazing of cattle, etc.
- *Unclassed forests:* According to the classification by legal status, this category includes all other forests. Some of these forests are privately owned. All village forests are included in this category. In the hill States of the North-east, forests are owned by district councils, village community and even by individual households. All these come under the category of unclassed forests. In some parts of the country, there are forests on revenue land, which are normally assigned to the forest department for management. These are called as revenue forest or *Soyam* forests.

**2.5.1 Common water resources:** Typically, an Indian village uses a number of water sources, usually of different types, to meet their needs. Besides meeting needs for domestic purposes, such as drinking, bathing, washing etc., these sources provide for irrigation, feeding and washing of livestock, fishing and needs of other household enterprises. Many of the water sources used by villagers are owned by individual households. But in most of the villages, there are some sources which are meant for community use. These are either held by the village community as a whole or a caste/religion/occupation-based community or a community based on traditional social order or community of persons of a geographical location. There are also sources of water which are either constructed by or lie within jurisdiction of a government department. All these sources, whether or not controlled by a community or a local body, which are not held by individual households, have been treated as common water resources.

**2.6.1 Community management of water resources:** Management of water resources by a local body, whether formal or informal, has been referred to as community management of common water sources. Apart from local self-government (like panchayat) and formal local organisations (like co-operative, pani panchayat, sinchai samitis and other farmers associations), totally informal but functionally effective local-level organisations for managing common water resources are commonly found in a large number of villages. All such informal bodies in addition to the formal bodies as forming part of community management were also considered for this survey.

## **2.7 Common property resources**

**2.7.1 Common property resources (CPRs)** have been defined in a number of alternative ways in the available literature. The element that is common to most of these definitions attributes primary importance to the nature of access in identification of CPRs. The conceptual approaches vary over a wide range. At the one extreme, there is an approach treating all that is not private property as common property. The approach at the other extreme adopts a much more stringent view to distinguish between common property and “free rider” or “free or open access” resources. The latter category is characterised by absence of any rules for management of the resources. The proponents of this approach hold that “a resource becomes common property only when the group of people who have the right to its collective use is *well defined*, and the rules that govern their use of it are set out clearly and followed universally”. In their view, common property implies existence of an institutional arrangement for management of the resources.

**2.7.2** Traditionally, systems of community management of CPRs and forest land had existed in different forms in many parts of the country till the end of the 19th century. A very large part of the country’s natural resources was common property, in the sense that a wide variety of necessary resources was freely available to the rural population. The process of extending state control over the common resources, which began with the declaration of “reserved” and “protected” forests in the closing years of the 19th century, has essentially been that of exclusion of villagers’ access to common resources by law. As a result, the systems of community management gradually disintegrated and are now virtually extinct.

**2.7.3** Today, in almost all parts of the country, the villagers have legal right of access only on some specific categories of land like ‘pasture and grazing lands’ and ‘village forests’, which are under the jurisdiction of the village or village *panchayat*. All other categories of land not under private ownership like barren and uncultivable land, culturable waste, land put to non-agricultural uses and forests belong to State Revenue department or Forest department. Nevertheless, the rural population, particularly the poor, depend greatly on the goods and services available from these categories of land. Besides, though only those resources are treated as CPRs on which no individual has exclusive property rights, there are systems of customary rights which support traditional practices, such as gleaning or grazing of cattle in the fields after harvest, which represent common rights on private property in certain situations.

2.7.4 Keeping the variety of conceptual approaches and their implications in mind, two distinctly different approaches were adopted for collection of data on CPRs in the present enquiry. First, called *de jure* approach, was used for collection of data on the size of CPRs. In this approach, only those resources were treated as CPRs which were within the boundary of the village and were formally (i.e. by legal sanction or official assignment) held by the village *panchayat* or a community of the village. The second approach, called *de facto* approach, was adopted for collecting information on use of CPRs. In this approach, the coverage of CPRs was extended to include resources like revenue land not assigned to *panchayat* or a community of the village, forest land, or even private land in use of the community by convention. The common use of private property may be confined to particular seasons as in the cases where cultivated land are used for grazing between crops, fields submerged during monsoon are used for fishing etc. All such land which are in practice used as common resources were treated as CPRs for data collection on benefits accruing to villagers from the CPRs even if they were located outside the boundary of the village.

# Chapter III

## Sample Design and Estimation Procedure

3.0 Since in the 54<sup>th</sup> round of the NSS the survey on Cultivation Practices was conducted in the rural areas only, the sample design and estimation procedure, too, have been stated below only for the rural areas.

### 3.1 Sample Design

3.1.1 A stratified multi-stage sampling design was adopted for the survey. The first stage units were census villages (*panchayat* wards in the case of Kerala). Households formed the ultimate-stage units.

3.1.2 *Sampling frame for first-stage units (FSUs):* The list of census villages of the 1991 population census (the 1981 census list for J & K) constituted the sampling frame for most of the States. For Kerala, however, the list of *panchayat* wards was used as the sampling frame for selection of *panchayat* wards. For Nagaland, the villages located within 5 km of a bus route constituted the sampling frame, whereas for Andaman & Nicobar Islands, the list of accessible villages constituted the sampling frame.

3.1.3 *Stratification:* From the list of villages of each State/Union Territory (UT), initially three separate strata were formed by considering villages (a) with very small population (b) with no population and (c) with very high population. These are formally stated below:

- stratum 1 : all uninhabited villages (as per the 1991 census)
- stratum 2 : villages each with a population of 1 to 50 (including both the boundaries) as per the 1991 census
- stratum 3 : villages each with a population of more than 15,000 as per the 1991 census

Each of the above three strata was formed only when there were at least 10 villages of the specified population in the State/UT as per the 1991 population census. Otherwise, these villages were included in the general strata as described below.

3.1.4 After formation of the strata 1, 2 and 3 (wherever applicable), the remaining villages of the State/UT were considered for formation of the general strata. Each district with a population of less than 2 million as per the 1991 census formed a separate stratum. A district having a population of 2 million or more was divided into two or more strata, depending on its population,

as per the usual procedure followed in the NSS. For Gujarat, some districts cut across NSS regions. In such cases, the part of a district falling in an NSS region formed a separate stratum.

**3.1.5 Allocation of first-stage units (FSUs):** A total all-India sample of 5242 villages for the Central sample were allocated to the States/UTs in proportion to their investigator strength. State/UT level rural/urban allocations are given in Table T<sub>0</sub>.

**3.1.6** Next a suitable sample size – minimum 2 and maximum 6 villages; the exact number depending on the total number of villages in the frame - was allocated to stratum type 1 of rural areas of each State and UT. In all, 68 sample villages were allocated to stratum 1 of the rural areas, considering all those States/UTs where stratum type 1 was formed. From stratum 2, a sample of a maximum of 6 villages was selected from each State and UT. The number of sample villages from stratum 3 was either 2 or 4 depending upon whether the number of villages in the frame of stratum type 3 was less than 20 or more. The remaining sample size (i.e. total allocation for the rural areas less the allocations for strata 1,2 and 3) of rural areas of each State and UT was allocated to the general strata (i.e. the strata other than strata 1, 2 and 3) in proportion to their populations.

stratum type	selection procedure

3	-do- *
others	css with pps *

(css : circular systematic sampling, pps : probability proportional to size, size = population)

@ arrangement of villages in the frame is the same as that of the census

\* after arranging the FSUs in an ascending order of population

**3.1.7 Selection of first-stage units :** The selection of the sample FSUs was done in the form of two independent sub-samples as follows :

**3.1.7 Selection of hamlet-groups in rural areas:** There are villages in India which contain large population. Listing all the households of such a village requires considerable amounts of time and effort of field officials. To limit their work-load at this stage of the survey operation, the large villages were further subdivided into a specified number of parts, by grouping contiguous natural hamlets, in such a way that each group contained natural hamlets, approximately with an equal fraction of the village population. These groups of hamlets were called hamlet-groups (hgs). From the specified number of hamlet groups (depending upon the approximate present population) thus formed, a random sample of the hamlet-groups was drawn for the subsequent stages of the survey. The number of hamlet-groups formed and selected for the survey were as follows:

approx. present population of village	no. of hgs formed ( $D$ )	no. of hgs selected for survey( $d$ )
less than - 1200	no hg formation	entire village is selected for survey
1200 - 1999	4	2
2000 - 2499	5	2
2500 - 2999	6	2
3000 - 3499	7	2
3500 - 3999	8	2
4000 - 4499	9	2
4500 - 4999	10	2
5000 - 5499	11	3
.	.	.
.	.	.
.	.	.
9500 - 9999	20	3
10000 - 10499	21	4
.	.	.
.	.	.
.	.	.
14500 - 14999	30	4
15000 - 15499	31	5 <sup>@</sup>
and so on		

<sup>@</sup> 5 hgs were selected for survey from each selected village having approx. present population of 15000 or more

However, for the rural areas of Himachal Pradesh, Sikkim, and Punjab, Rajouri, Udhampur and Doda districts of Jammu & Kashmir, the limit was  $D=1$  for a population of less than 600,  $D=4$  for a population of 600 - 1199;  $D=5$  for a population of 1200 - 1499;  $D=6$  for a population of 1500 - 1799 and so on. The number of hgs selected for the survey was  $d=2$  for  $D=4$  to 10,  $d=3$  for  $D=11$  to 20,  $d=4$  for  $D=21$  to 30 and  $d=5$  for  $D>30$ .

**3.1.9 Second-stage stratification (for selection of households):** In rural areas, all the households of a sample village, or the selected hamlet groups of it, were classified into 3 second-stage strata. The households engaged in free collection (other than fuelwood and marine fishing) formed second-stage stratum 1. Other rural households were grouped into two second-stage strata - those with wage/salary earning but possessing land less than 0.40 hectare formed second-stage stratum 2 while the rest of the households formed second-stage stratum 3. The households of second-stage stratum 3 in rural areas were arranged by area of land possessed

before sample selection. In urban areas also, the households were grouped into three second-stage strata, but by following a procedure different from that followed for rural areas.

3.1.10 *Selection of households* : For schedule 31, a sample of 16 households from each selected village (or selected hamlet-groups) was selected for the survey.

3.1.11 The 16 households selected from each selected village (or selected hamlet-groups) were allocated among the three second-stage strata in proportion to the number of households in the respective frames with a minimum allocation of 4, 2 and 2 households, respectively, to second-stage strata 1, 2 and 3.

3.1.12 While allocating the above total number of sample households among the three second-stage strata, if allocation for one particular second-stage stratum was less than the minimum allocation specified for the second-stage stratum, its quota was increased to the said minimum number and the residual total allocation was allocated between the other two second-stage strata in proportion to the total number of households in the respective frames. The sample households were selected circular systematically with independent random starts from the respective frame of households in each second-stage stratum.

---

## 3.2 Estimation Procedure

3.2.1 The estimation procedure adopted in the 54th round for schedule 31 is briefly indicated here.

3.2.2 *Notation*: The notation used for describing the estimation procedure is as given below:

$s$  = subscript for stratum

$i$  = subscript for sample village

$j$  = subscript for second-stage stratum of a sample village

$k$  = subscript for sample household

$b$  = subscript for sub-sample ( $b=1, 2$ )

$z$  = size of the sample village used for selection

$Z$  = total size for a stratum as per the frame

$n$  = number of sample villages (i.e. no. used for tabulation) surveyed including uninhabited and zero cases and excluding casualty and other not received cases

$D$  = number of hamlet-groups formed in the sample village

$d$  = number of hamlet-groups selected for survey

$H$  = total number of households listed in the frame

$h$  = number of sample households available for tabulation

$y$  = value of any characteristic under estimation in a sample village/household

$\bar{Y}$ = estimate of population total of the characteristic  $y$

### 3.2.3 Estimates of aggregates:

For schedule 31, the formula used for the estimation of the aggregates of the  $s$ -th stratum and  $b$ -th sub-sample is as specified below:

$$\bar{Y}_{sb} = \frac{Z_s}{n_{sb}} \sum_{i=1}^{n_{sb}} \frac{D_{sbi}}{d_{sbi}} \frac{1}{Z_{sbi}} \sum_{j=1}^3 \frac{H_{sbij}}{h_{sbij}} \sum_k y_{sbijk}$$

Note: (i) For strata 1,2 and 3 in the rural sector,  $z=1$  and  $Z$ = total number of villages in the frame of the respective strata whereas for other strata in the rural sector,  $z$ = population of the sample village as per the frame used for selection and  $Z$ = total population of the stratum.

(ii) When  $D=1$ ,  $d=1$  and for  $D \geq 4$ ,  $2 \leq d \leq 5$

(iii) When  $H>0$  but  $h=0$  for any second-stage stratum, that second-stage stratum was merged with any of the other two second-stage strata. In particular, if  $h=0$  for  $H>0$  for the 1st second-stage stratum, it was merged with the 3rd second-stage stratum. If second-stage stratum 2 became a casualty, it was merged with second-stage stratum 3. Lastly, if second-stage stratum 3 became a casualty, it was merged with second-stage stratum 1.

The pooled estimate of the  $s$ -th stratum based on two sub-samples has been obtained as

$$\bar{Y}_s = \frac{1}{2} \sum_{b=1}^2 \bar{Y}_{sb}$$

The pooled estimate  $\bar{Y}$  at the region/State/UT/all-India has been obtained by summing the stratum estimates  $\bar{Y}_s$  over all the strata of the region/State/UT/all-India.

3.2.4 *Estimates of ratios:* The estimate of the ratio  $R = \frac{Y}{X}$  (where  $X$  and  $Y$  are the

population totals of the two characters) was obtained as  $\bar{R} = \frac{\bar{Y}}{\bar{X}}$ .

**Table T<sub>0</sub>: First-Stage and Second-Stage sample size**

## **Chapter IV**

### **Summary of Findings**

4.1.1 The present enquiry on common property resources (CPRs) aims at assessing their role in the life and economy of the rural people. In recent years, use of common property resources in India has drawn the attention of planners and policy-makers dealing with wasteland development, anti-poverty programmes and environmental problems. The Planning Commission, while exploring the prospects and strategies for bio-mass fuel and fodder supplies in the rural areas for the Eighth Plan, recognises the important role of the CPRs in this respect and acknowledges the need for surveys to measure their extent.

4.1.2 The beginning of studies of CPRs in India can be traced back to early 1980s. Since then, a large number of field studies have been conducted. These studies mostly deal with the nature and extent of dependence of the rural poor on the CPRs for their bio-mass needs, depletion and degradation of the CPRs and the existing systems of community management of these resources. Some of these studies covered a fairly large number of villages scattered over a vast area of the country, some were confined within a State or a region of a State and a majority were in the nature of case studies. These studies provide detailed information on the nature, size and contribution of the CPRs, problems relating to access to them and the factors underlying the depletion and degradation of these resources. But they offer little help in understanding their role and associated problems at the national or State level. Moreover, most of these studies were conducted in the arid and semi-arid areas or hill and forest fringe regions of the country. The present enquiry, therefore, is the first attempt to provide comprehensive State- and national-level estimates of size, utilisation and contribution of CPRs. It also provides separate estimates for agro-climatic zones.

4.1.3 Broadly speaking, common property resources refer to all such resources which are accessible to the whole community and to which no individual has exclusive property rights. The rights and practices determining the access to these resources are generally conventional. In India, CPRs include village pastures and grazing grounds, village forests and woodlots, protected and unclassed government forests, waste lands, common threshing grounds, watershed drainage, ponds and tanks, rivers, rivulets, water reservoirs, canals and irrigation channels. The CPRs have traditionally been a source of economic sustenance of the rural poor and have played an important resource-supplementing role in the private-property based farming system. They are also the main source of bio-mass fuel for the rural population. In the present enquiry, data on size and all forms of use of the CPRs were collected using two different conceptual approaches. Of the three main categories of CPRs, viz. land, water and forests, the present enquiry attempts to estimate the magnitude of CPRs in land only.

4.1.4 The major findings of the enquiry on common property resources are summarised in this chapter. It starts with the survey estimates on magnitude of common property land resources while comparing them with the estimates available from various other studies. This is followed by an overview of the extent and nature of dependence on CPRs, in terms of value of materials collected by the rural population from these resources and other benefits derived from them. The amount of fuelwood and fodder collected from the CPRs are then discussed in some detail. Finally, the survey results indicating the contribution of CPRs in irrigating land of privately operated farms are discussed in relation to the role of community management of common property water resources.

## 4.2 Size of Common Property Land Resources

4.2.1 Two schedules of enquiry were used for data collection on CPRs in the survey. Broadly speaking, one was meant for collection of information on availability of different kinds of CPRs and was canvassed for each village in the sample. The other schedule was canvassed in each household in the sample. A part of this schedule was meant for recording information on utilisation of the CPRs by the households. The data on area of common property land resources were collected following both *de jure* and *de facto* approaches and were recorded separately in the village schedule. The field officials were advised to consult local officials and knowledgeable persons of the village for ascertaining the area. The estimates of common property land resources presented in this report are based on the data of area collected using the *de jure* approach.

4.2.2 Table T1 gives the estimates on availability of common property land resources obtained using *de jure* approach from the survey. Common property land resources, as per this approach, include

Table T1: Availability of common property land resources in rural India

Item	estimate
1. Percentage of common property land resources in total geographical area	15
2. Common property land resources per household (ha)	0.31
3. Average household size	5.04
4. Common property land resources per capita (ha)	0.06
5. Components of common property land resources: (Percentage)	
community pastures and grazing grounds	23
(village forests and woodlots	(3.45 %)
other	16
	(2.40 %)
	61
	(9.15 %)

*Note:* The figures in parentheses in Item 5 represent percentage to geographical area.

the categories of land like community pasture and grazing grounds, village forests and woodlots and village sites, on which the villagers have legal usufructuary rights. These also include all other land

formally held by the *panchayat* or a community of the village. In fact, all *panchayat* land, even when given on lease to an individual or to any organisation, was considered as common property. Government forests, i.e. land under the jurisdiction of the Forest Department, and land put to non-agricultural uses (except the land under water bodies) were excluded from the coverage of common village land in *de jure* approach.

4.2.3 The restrictive definition of CPRs in the *de jure* approach excludes all Government forests and revenue land which in practice may actually be used as common property. Yet it is seen that common property land resources form a substantial part (15%) of the total geographical area. This estimate is based on the data on area of CPR land collected in the survey and the geographical area of the surveyed villages given in the Primary Census Abstract (PCA), 1991. In many cases, however, geographical area is not available in the PCA. In particular, the PCA does not provide village-wise area figures for Jammu & Kashmir and the north-east hill States of Manipur, Meghalaya, Arunachal Pradesh and Mizoram. For Assam too geographical area is available from the PCA for only 13 of the 214 surveyed villages. Besides these, geographical area is not given in the PCA for a number of surveyed villages in the other States. The estimate of percentage of area of CPR land to geographical area is based on the data of the villages for which geographical area is provided in the PCA. Moreover, as the first stage sampling units for Kerala were *panchayat* wards instead of census villages, the data on CPRs for Kerala relate to the selected *panchayat* wards and not to the entire village to which they belong. Thus, the data of Kerala were not used for estimating the percentage of CPR land to geographical area. Table T2 gives the number of surveyed villages for which geographical area is not given in the PCA. It is seen that, out of a total of 5,114 villages surveyed, geographical area is not available from the PCA for 924 villages.

4.2.4 *Other problems relating to area estimates:* The data on CPR land and forest area collected in the survey was compared with the geographical area available in the PCA and area of forest given in the Village Directory (1991) of the Registrar General. In a very large number of cases, the survey data on CPR land or forest area were found to exceed geographical area or forest area available from the Census data. Over 700 such inconsistent cases were detected at the data processing stage. Out of these, about 60 cases related to area of CPR land. Owing to resource constraints, only the latter were re-examined and checked with the entries in the schedules of enquiry. In most of these cases, inconsistency with the census figure remained unresolved. In fact, it was found that there were a number of inconsistent cases within the Census data as well. For example, geographical area given in the PCA was found to be less than the area under non-agricultural use given in the Village Directory in quite a few cases. Thus, no attempt was made to correct the survey data relating to area on the basis of Census data. Very high figures reported as CPR land in the survey were kept unchanged. Most significantly, two villages in Rajasthan were reported to have more than 10,000 sq. km. of CPR land, of which one was found to have a geographical area of about 69,000 sq. km according to the PCA.

Table T2: Number of surveyed villages for which geographical area is not available in the PCA

State	no. of villages	State	no. of villages
Andhra Pradesh	7	Manipur	60
Arunachal Pradesh	52	Meghalaya	70
Assam	201	Mizoram	42
Bihar	6	Nagaland	28
Goa	1	Orissa	2
Gujarat	4	Rajasthan	1
Jammu & Kashmir	192	Sikkim	4
Kerala	204	Tamil Nadu	29
Madhya Pradesh	1	Uttar Pradesh	1
Maharashtra	3	A. & N. Islands	16
		India	924

4.2.4 The problems with the data on area of CPR land notwithstanding, the survey estimates do indicate the broad order of magnitude of common property land resources. The average CPR area available to a household works out to 0.31 ha while average area of land owned by a rural household was estimated as 0.84 ha from the same survey.<sup>1</sup> There is, however, a tendency on the part of the respondents, particularly those with ownership of large area of land, to under-report the area of land owned. This is a general problem of surveys based on interview method of data collection. Thus, the estimate of average area owned cited above is likely to be on the lower side. Nevertheless, the estimates of area of CPR land per household (0.31 ha) and average area of land owned (0.84 ha) by a household signify the relative importance of common property in land-based agricultural economy of rural India.

4.2.5 *Comparison with estimates based on other secondary data:* A preliminary comparison with the figures worked out from secondary data indicate that the survey estimates of size of CPR land are perhaps on the lower side. The area of CPR land obtained by reclassification of land-use statistics (LUS) is found to constitute about 22% of the geographical area<sup>2</sup>, whereas the corresponding estimate from the present enquiry is just 15%. The CPR area worked out from LUS, however, includes protected and unclassed forests as well as the part of privately owned land presumed to permit common access by customary rights. Excluding these components from the CPR area, the estimate comes down to about 9%, which is much lower than that obtained from the present survey. This calls for a closer examination of the survey estimates.

<sup>1</sup> See NSS Report No. 451: *Cultivation Practices in India*, NSS 54th Round.

<sup>2</sup> This estimate is based on Land Use Statistics for the year 1980 and is taken from:

Chopra, Kanchan et. al. (1990) *Participatory Development; People and Common Property Resources*, Sage, N.Delhi

4.2.6 It is seen from Table T1 that 61% of the CPR land fall in the category ‘other’, which includes village site, threshing floors etc. and other barren or waste land. In the *de jure* approach, only that part of the barren and uncultivable land and culturable wastes was required to be considered as CPR which was under the formal (i.e. by legal sanction or official assignment) control of the village *panchayat* or a community of the village. But so high a share of this category in the CPR land (which is equivalent to over 9% of the total geographical area) suggests that, in many cases, the criterion of ‘formal control’ was improperly applied while identifying CPR. A large part of “free access” revenue land, it appears, was misidentified as CPR land. However, the estimated percentage of community pasture and grazing land to total geographical area obtained from the survey (3.45%) is found to be of the same order as the corresponding estimate (3.65%) based on LUS data mentioned above.

Table T3: Availability of CPR land in different States

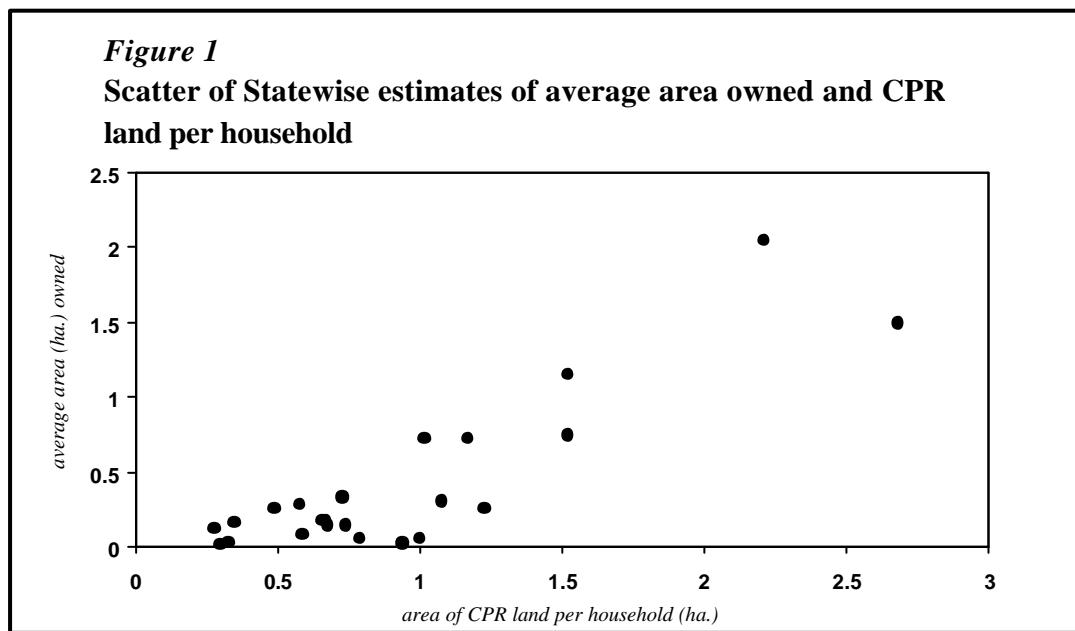

State	area owned per household*	CPR land per household (ha)	percentage of CPR land to geo. area@
Andhra Pradesh	0.67	0.17	9
Arunachal Pradesh	1.52	1.15	-
Assam	0.79	0.05	7
Bihar	0.59	0.08	8
Gujarat	1.17	0.72	27
Haryana	1.00	0.05	3
Himachal Pradesh	0.73	0.33	12
Jammu & Kashmir	0.68	0.14	-

Uttar Pradesh	0.74	0.14	12
West Bengal	0.33	0.03	2
India	0.84	0.31	15

\* The estimates given in this column are taken from NSS Report No. 451: Cultivation Practices in India, NSS 54th Round.

@ The dashes ( - ) in this column indicate that the village-wise geographical area is not available from the PCA, 1991. For Kerala, however, the data collected in the survey pertain to *panchayat* wards and not to the entire village to which they belong.

**4.2.7 Inter-State variation in availability of CPR land:** Percentage of CPR land to total geographical area and per household availability of CPR land in different States are given in Table T3. It is seen that average area of CPR land available to a household varies over a wide range from 0.01 ha (in Tripura) to 4.37 ha (in Mizoram). Except for Tripura, Manipur and Sikkim, all the hill States of the north-east have high CPR land per household. The north-eastern States apart, CPR land per household was the highest in Rajasthan (2.04 ha), followed by Madhya Pradesh (0.74 ha) and Gujarat (0.72 ha). The group of States where the availability was low — with CPR land per household less than 0.17 ha — consists of Tripura, Punjab, West Bengal, Assam, Haryana, Bihar, Kerala, Jammu & Kashmir, Uttar Pradesh, Tamil Nadu, Andhra Pradesh and Manipur. There are five States, viz. Karnataka, Sikkim, Orissa, Maharashtra and Himachal Pradesh, with availability of CPR land per household falling between 0.25 ha to 0.33 ha. The percentage of CPR land to geographical area, it is seen, varies from 1% (in Tripura and West Bengal) to 32% (in Rajasthan) across the States for which geographical area is available from the PCA.

**4.2.8** Another feature of significance revealed by the table concerns the relation between private property and common property in respect of land resources. The five highest figures of average area owned per household are reported for Nagaland (2.68 ha), Rajasthan (2.21 ha), Arunachal Pradesh (1.52 ha), Madhya Pradesh (1.52 ha) and Gujarat (1.17 ha). The estimates of availability of common land are also relatively high in all these States. The observed positive association between State-level estimates of average land owned and common land per household (see *Figure 1*) is no doubt due to the fact that population pressure, which restricts the amount of land owned per household, also limits the amount of CPR land available per household.

**4.2.9 Varying availability of CPR land in different agro-climatic zones:** A fairly large number of field studies on common property resources undertaken by scholars in recent years show that the

availability and utilisation of CPR depends on the agro-climatic conditions and vary even with a State. To examine how the availability of and dependence on CPRs depend on agro climatic factor, the results of the present survey are given separately for different agro-climatic zones of the country. The detailed statistical tables given in Appendix I give the estimates for different agro-climatic zones of each State, whenever sample size permits. For this purpose, the entire country has been divided into 15 agro-climatic zones (A-C zones) as defined by the Planning Commission while formulating the Eighth Plan. These A-C zones cut across State boundaries. The details of composition of these **A-C zones** are given in **Appendix II** of the present report.

4.3.10 The estimates of percentage of CPR Land in total geographical area, and CPR Land per household given in Table T4 indicate the availability of CPRs in different A-C zones of the country. It is seen that percentage of geographical area considered as CPR in *de jure* approach varies over a wide range from 1% in the lower Gangetic Plains(LG) to 38% in the Western dry region (TD) of Thar Desert. The CPR land available per household also varies as widely from 0.02 ha in LG to 4.77 ha in TD. The estimated CPR land per household is indeed much higher in TD than in the other zones. The semi-arid zone of Gujarat Coast, Plains & Hills(GC) comes closest to TD in respect of availability of CPR land. But CPR land per household in GC(0.71 ha) is found to be much smaller than that in TD. The difference between the estimates of percentage of CPR land to total geographical area for these two zones, however, do not differ as widely as the CPR land per household. The exceptionally high value of CPR land per household estimated in TD owes to two geographically large villages in the sample of Rajasthan (see paragraph 4.2.4).

Table T4: Percentage of CPR land to geographical area and availability of CPR land per household and per capita

Agro-climatic zone	percentage of CPR land to geo. area	CPR land per household (ha)	average household size	CPR land per capita (ha)
Lower Gangetic Plains (LG)	1	0.02	5.02	0.00
Upper Gangetic Plains (UG)	2	0.03	5.38	0.01
Middle Gangetic Plains (MG)	8	0.07	5.69	0.01
Trans-Gangetic Plains (TG)	5	0.07	5.61	0.01
all Islands (Isl)	9	0.12	4.41	0.03
East Coast Plains & Hills (EG)	12	0.15	4.28	0.04
Western Coast Plains & Hills (WC)	10	0.16	4.57	0.04
Eastern Himalayas & Bramhaputra Valley (EHm)	5	0.18	5.08	0.04
Southern Plateau & Hills (DP)	9	0.18	4.36	0.04
Western Plateau & Hills (WHg)	10	0.29	5.10	0.06
Eastern Plateau & Hills (EHg)	19	0.44	4.78	0.09
Western Himalayan (WHm)	33	0.49	5.00	0.10
Central Plateau & Hills (CHg)	20	0.65	5.23	0.12
Gujarat Coast Plains & Hills (GC)	27	0.71	4.95	0.14
Western Dry Region (TD)	38	4.77	5.75	0.83
India	15	0.31	5.04	0.06

4.2.11 The estimates of per household availability of CPR land, given in Table T4, confirm the findings of the field studies on CPR conducted in recent times. It is seen that the CPR land ranged from 9% to 38% of the geographical area in the arid and semi-arid areas of the country. The availability of CPR land per household too was relatively high in these areas. Besides the A-C zones TD and GC, the per household CPR land was also high in the semi-arid zones like Central Plateau & Hills (CHg) and Western Plateau & Hills (WHg). Per household CPR land was also found to be high in the A-C zones Western Himalayan (WHm) and Eastern Plateau and Hills (EHg). Both these A-C zones are endowed with large tracts for forest land and traditional institutions of community management. The only dry tropical A-C Zone with relatively low per household CPR is found to be Southern Plateau and Hills (DP). However, the relatively low estimate of availability of CPR in the other A-C Zone containing large hilly tracts, viz. Eastern Himalayan and Bramhaputra Valley (EHm), does not reflect the variation within the region. It is seen from Table T3 that the tribal hill States of the north-east do have high percentage CPR Land in Geographical area, while Assam, containing large part of the Bramhaputra valley, has a small part of geographical area as CPR land. The A-C zones where the availability of CPR land are found to be rather low (0.7 ha per household or less), viz. lower (LG), Middle (MG), Trans (TG) and Upper (UG) Gangetic plains, are among the agriculturally developed areas of the country and are endowed with rich and fertile soil.

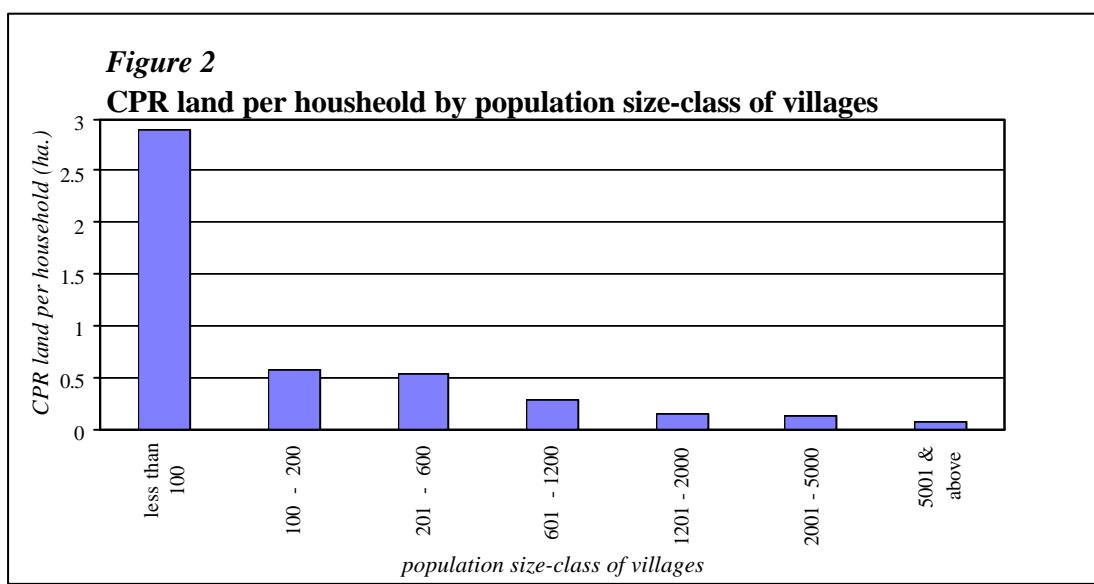

4.2.12 Table T5 gives the percentage distribution of CPR land by category for the A-C zones with high or moderately high availability of CPR land. In the present survey, data on area were collected separately for four broad categories of CPR land, viz. (i) common pasture and grazing land, (ii) village forest & wood lot, (iii) village site, threshing floor etc. and (iv) other barren or waste land formally held by *panchayat* or any community of the village. In Table T5, separate estimates are given for the first two categories and the estimates of other two categories are pooled and given separately under a broader category called 'both'.

Table T5: Percentage distribution of CPR land by category of CPR land

agro-climatic zone	permanent pasture & grazing land	village forests & woodlots	other	all
East Coast Plains & Hills (EG)	20	7	73	100
Western Coast Plains & Hills (WC)	38	13	50	100
Eastern Himalayas & Bramhaputra Valley (EHm)	22	50	28	100
Southern Plateau & Hills (DP)	28	11	61	100
Western Plateau & Hills (WHg)	31	24	45	100
Eastern Plateau & Hills (EHg)	30	27	45	100
Western Himalayan (WHm)	43	31	27	100
Central Plateau & Hills (CHg)	34	18	46	100
Gujarat Coast Plains & Hills (GC)	28	4	68	100
Western Dry Region (TD)	4	1	95	100
India	23	16	61	100

4.2.13 In all the arid and semi-arid A-C zones, except TD, the category “common pasture and grazing land” is found to be an important constituent of the CPR land. The estimates for TD, based on the sample containing two very large villages(see paragraph 4.3.4), fail to reflect the relative shares of different categories of CPR land in the zone. The highest share of the category “common pastures and grazing land” in CPR land was, however, reported in the mountainous A-C zones WHm. It was relatively high also in the A-C zone West Coast Plains & Hills, containing the high-rainfall regions of Western Ghats and coastal areas.

4.2.14 ‘Village forest & wood lot’ is found to be an important constituent of CPR Land in the A-C Zones, Eastern Himalayas and Bramhaputra Valley (EHm) (50%), Western Himalayas (WHm) (31%) and Eastern Plateau and Hills (EHg) (27%). In the tribal areas of the hill States of the north-east, land is generally owned by district councils or village communities or tribal clans. A large part of the geographical area in these States are under forest cover and are traditionally managed as common property. In the A-C Zones WHm and EHg too over a fourth of the CPR land falls in the category of village forests. Besides the *Van panchayats* in the Western Himalayan regions of Uttar Pradesh, it appears, there are similar institution of community management of forests in the other parts of the A-C zone WHm. It is seen that 31% of CPR land in this zone fall in this category. In Orissa, the major constituent of the A-C zones EHg, there are forests called “Gramya Jungle”, on which the villagers enjoy rights over fuelwood, fodder and other minor forest produce. Village forests, therefore, constitute 27% of the CPR land in A-C zone EHg.

4.2.15 Availability of CPR land and population size of villages: In general, the less developed villages are known to be less populated than the developed ones. Thus, to examine the widely held view that the availability of CPR land is higher in the less developed villages, the data on CPR land

collected in the present survey were used to generate estimates of area of CPR land per household for varying population size class of villages. For this purpose, the villages in the sample were classified according to Census '91 population. Figure 2, which is based on these estimates, clearly reveals that the smaller the population of a village the higher is the per household availability of CPR land. The data of Rajasthan were, however, excluded while working out the estimates for Figure 2, since the sample for Rajasthan included two villages with exceptionally large geographical area which were reported to have equally large area of CPR land. Also, it is important to note that the population size class less than 100 includes uninhabited villages and the data on CPR land reported for them were also taken into account while generating the estimates. Thus, the estimate of CPR land per household (2.90 ha) for this size-class is much higher than those of the other size-classes.

**4.2.16 Depletion of CPR land:** There is evidence indicating a rapid decline in CPRs, both in size and productivity. In the present survey, an attempt was made to assess the rate of depletion in the size of CPR land. Table T6 gives the rate of depletion alongside the present per household availability of CPR land for each A-C zone. It is important to note that the estimates of rate of depletion are based on the data on the present area of CPR land and the area that had existed five years ago. Data on both were collected by *de jure* approach during the present survey.

**4.3.17** Table T6 indicates that the area of CPR land in rural India is declining at a quinquennial rate of 1.9%. The two fastest rates of decline were observed in the A-C zones Middle Gangetic (7.2%) and Trans-Gangetic (7.1%), where the present per household availability of CPR land is as low as

Table T6: Rate of reduction in CPR land during last 5 years in each agro-climatic zone

Agro-climatic zone	Reduction in CPR land during 5 years preceding the survey (per 1000 ha)	CPR land per household (0.00ha)
Western Himalayas (WHm)	2	0.49
East Himalayas & Bramhaputra Valley (EHm)	23	0.18
Lower Gangetic Plains (LG)	26	0.02
Middle Gangetic Plains (MG)	72	0.07
Trans-Gangetic Plains (TG)	71	0.07
Upper Gangetic Plains (UG)	28	0.03
Eastern Plateau & Hills ( EHg)	50	0.44
Central Plateau & Hills (CHg)	15	0.65
Western Plateau & Hills (WHg)	13	0.29
Southern Plateau & Hills (DP)	43	0.18
East Coast Plains & Hills ( EG)	13	0.15
West Coast Plains & Hills (WC)	0	0.16
Gujarat Coast Plains & Hills (GC)	1	0.71
Western dry region (TD)	2	4.77
all Islands (Isl)	5	0.12
India	19	0.31

0.07 ha Relatively high rates were also reported in the A-C zones Eastern Plateau & Hills (5%) and Southern Plateau & Hills (4.3%).

### 4.3 Dependence on CPRs

4.3.1 CPRs play an important role in the rural economy and benefit its population in a number of ways. The fuelwood and shrubs available from them are used for cooking and heating; grass, leaves and shrubs are used as animal fodder, bamboo, small timber and palm leaves for housing and a variety of fruits, vegetables and fish, for sustenance, particularly during the lean seasons. CPRs also contribute significantly to private-property based farming as well as to the household enterprises. These provide irrigation water, mulch and manure for cultivation, raw materials and common pastures for grazing.

4.3.2 To assess the contribution of CPRs, data on collection of different materials like fuel wood, fodder, manure, weeds, grass, edibles, and medicinal herbs from them as well as other kinds of their use by the villagers were collected from each household in the sample. A *de facto* approach was adopted for this purpose (see paragraph 2.7.4). All land and water resources actually used as common property was treated as CPRs in this approach. Thus, the estimates on benefits accruing from CPRs given in this report represent the magnitude of collections from and the extent of other uses of the resources like government revenue land, government forests — reserved as well as other — ponds and tanks, rivers, water reservoirs and canals as well as common pastures villages forests and *panchayat* land.

Table T7: Use of common property resources

item	estimate
1. Households reporting collection of any material from CPRs	48 %
2. Average value of annual collections per household	Rs 693
3. Ratio of average value of collection to average value of consumption expenditure	3.02 %
4. Households reporting grazing of livestock on CPRs	20 %
5. <i>Households reporting use of common water resources for:</i>	
(i) irrigation	23 %
(ii) livestock rearing	30 %
(iii) household enterprise	2.8 %

4.3.3 Table T7 gives the estimates of some basic parameters indicating the extent of use of CPRs by the rural households. About half of the rural households, it is seen, collect some material or the other from CPRs The average value of annual collections per household from CPRs work out to Rs

693, which amounts to 3% of the average consumption expenditure of a rural household.<sup>3</sup> Apart from collection of materials, rural population derives benefits from CPRs in many other forms. About one fifth of the households were found to have used CPRs for grazing their livestock. The common property water resources (CPWR) were also used by a large section of the rural population for various purposes. Most important use of CPWR is, no doubt, for irrigating the cultivated land. About 23% of the households reported use of water resources like tank, wells and tubewells owned by village panchayat or a community of the village or those provided by the government and government canals, rivers and springs, for irrigating their land during the 365 days preceding the date of survey. This demonstrates the important resource-supplementing role of CPRs in private-property based farming, as only 36% of the households were found to have used irrigation during the 365 days. Use of CPWR for livestock rearing was also found to be quite common — 30% of the households reported use of CPWR for this purpose. For other household enterprises, about 3% households reported use of CPWR.

**4.3.4** In the present survey, measuring the benefits in quantitative terms, accruing from CPRs was restricted to actual collections reported by the households. No attempt was made to quantify the

TableT8: Comparison between average value of collections from CPRs and average consumption expenditure

State	average value of collections from CPR (Rs)	MPCE <sup>@</sup> (Rs)	average household size <sup>@</sup>	ratio of value of collection to consumption expenditure (%)
Andhra Pradesh	554	386	4.3	2.78
Assam	1071	338	5.4	4.89
Bihar	519	289	5.4	2.77
Gujarat	663	416	4.8	2.77
Haryana	1174	546	5.8	3.09
Karnataka	635	365	5.0	2.90
Kerala	390	604	4.6	1.17
Madhya Pradesh	984	326	5.1	4.93
Maharashtra	799	384	4.8	3.61
Orissa	929	301	4.6	5.59
Punjab	1057	614	5.2	2.76
Rajasthan	266	452	5.4	0.91
Tamil Nadu	667	381	4.0	3.65
Uttar Pradesh	690	373	5.6	2.75
West Bengal	450	358	5.0	2.09
India	693	382	5.0	3.02

@ MPCE stands for monthly per capita consumption expenditure. These estimates are taken from NSS Report No. 448: *Household Consumption Expenditure and Employment Situation in India*, 54th Round NSS.

<sup>3</sup> The estimate of household consumption expenditure is taken from NSS Report No:448: *Household Consumer Expenditure and Employment situation in India*, based on the 54th Round of NSSO

benefits derived by way of grazing livestock on common pastures or drawing irrigation water from CPWR. The rest of this section deals with the value of materials actually collected from the CPRs

4.3.5 Table T8 gives the estimated value of annual collections from CPRs per household and its ratio to average consumption expenditure of a household for the major States. The estimates of household consumption expenditure used for deriving the ratios are based on data collected concurrently from a different sample of households drawn from each surveyed village. Thus the estimates involved in computation of the ratios given in the table refer to the same period, with the only difference that consumption data were collected with a reference period of 30 days, while data on value of collections from CPRs had a reference period of 365 days preceding the date of survey. The ratios given in the table, therefore, broadly indicate the level of dependence on CPRs, so far as the benefits are measured in terms of value of materials collected from them. What is important to note is that all collections from CPRs do not form part of consumption expenditure. The materials collected from CPRs include fuelwood both for home consumption and entrepreneurial activities, fodder for maintenance of livestock, and a variety of other materials used as food or as raw materials for household enterprises like rope making and basket weaving. Only the materials used for home consumption are considered while collecting consumption data.

4.3.6 The ratio of value of collections from CPRs to consumption expenditure works out to 3.02% at the national level. Table T8 shows that, among the major States, the ratio varies from 0.91% in Rajasthan to 5.59% in Orissa. The ratio is found to be relatively high in Madhya Pradesh (4.93%) and Assam (4.89%) as well. Relatively low values of the ratio are observed in Kerala (1.17%) and West Bengal (2.09%), besides Rajasthan.

4.3.7 In the States with the three highest values of the ratio, values of collections were also high in absolute terms. The average values of annual collections in Madhya Pradesh (Rs 984) and Orissa (Rs 929) are expectedly high, since 85% and 75% of the households, respectively, of these two States reside in villages either with a forest within reach or 0.10 ha of CPR land per household. In Assam, on the other hand, though only about 46% of the households reside in such villages, the average value of collection was as high as Rs 1,071. What is most striking, in this context, is that the average values of collections in Haryana (Rs 1,174) and Punjab (Rs 1,057) are among the highest three, though only 35% and 10% of the households respectively in these two States have a forest within their reach or more than 0.10 ha of CPR land per household. The case of Rajasthan too is equally striking. The average value of collections from CPRs is found to be the lowest (Rs 266) in this State, though 52% of its households reside in villages with 0.10 ha or more CPR land per household and 35% have a forest within their reach. In the other States with relatively low average value of collections from CPRs like Kerala (Rs 390) and West Bengal (Rs 450), however, only small fractions of households have enough CPR land for their use or a forest within their reach.

4.3.8 *Collection from CPRs in agro-climatic zones:* Table T9 gives the value of collections from CPRs and percentage of households reporting any collection from CPRs for each A-C zones. For working out the percentage, the households reporting some amount of collection of materials like fuelwood, fodder, manure, leaves, weeds, honey, fish and medical herbs during the 365 days preceding the date of survey were considered to have made collections from CPRs

TableT9: Average value of annual collections from CPRs and percentage of households engaged in collection activity for each agro-climatic zone

agro-climatic zone	average value of annual collections (Rs)	percentage of household s reporting collection	percentage of households residing in villages with		
			forest within reach	no forest but CPR land 0.10 ha per household	either
Western Himalayas (WHm)	1939	68	83	6	89
East Himalayas & Bramhaputra Valley (EHm)	1219	51	47	4	51
Lower Gangetic Plains (LG)	408	38	20	1	21
Middle Gangetic Plains (MG)	464	39	16	8	24
Trans-Gangetic Plains (TG)	528	30	18	14	32
Upper Gangetic Plains (UG)	1070	30	16	4	20
Eastern Plateau & Hills ( EHg)	845	73	70	9	79
Central Plateau & Hills (CHg)	744	47	53	34	87
Western Plateau & Hills (WHg)	674	58	43	27	70

West Coast Plains & Hills (WC)	715	31	38	2	40
Gujarat Coast Plains & Hills (GC)	658	56	31	50	81
Western dry region (TD)	230	13	30	50	80
all Islands (Isl)	467	68	88	0	88
India	693	48	38	16	54

4.3.9 Benefits accrued from CPRs, in the form of materials obtained from them, vary widely across the AC zones, both in terms of average value of collections and percentage of households engaged in collection activity. In general, it is seen that average value of collections from CPRs is not entirely dependent on the percentage of households reporting collections, nor is it determined by the availability of CPR land or forests. The table also provides the percentage of households residing in villages having 0.10 ha or more CPR land per household and those with a forest within villagers' reach.

4.3.10 *Materials collected from CPRs in agro-climatic zones:* Table T10 gives the percentage shares of different materials collected in the total value of collections from CPRs. The percentage shares given in the table are for three broad categories of materials, viz. fuelwood, fodder and 'other'. The last category includes materials used as manure; fruits roots, tubers and vegetables, gums & resins; honey & wax; medical herbs; fish; leaves and weeds. It is important to note that the values of timber and marine fish catch are not included in the value of collections.

Table T10: Percentage distribution of value of collections from CPRs by category of materials

agro-climatic zone	percentage distribution of value of collections				average value of collections (Rs)
	fuelwood	fodder	other	all	
Western Himalayas (WHm)	59	39	2	100	1,939
East Himalayas & Bramhaputra Valley(EHm)	53	8	39	100	1,219
Lower Gangetic Plains (LG)	48	5	47	100	408
Middle Gangetic Plains (MG)	52	39	9	100	464
Trans-Gangetic Plains (TG)	44	51	6	100	528
Upper Gangetic Plains (UG)	31	69	0	100	1,070
Eastern Plateau & Hills (EHg)	64	4	31	100	845
Central Plateau & Hills (CHg)	62	18	20	100	744
Western Plateau & Hills (WHg)	68	25	7	100	674
Southern Plateau & Hills (DP)	72	18	10	100	628
East Coast Plains & Hills (EG)	65	18	17	100	559
West Coast Plains & Hills (WC)	49	13	38	100	715
Gujarat Coast Plains & Hills (GC)	61	30	9	100	658
Western dry region (TD)	71	29	0	100	230
all Islands (Isl)	79	3	18	100	467
India	58	25	17	100	693

4.3.11 The estimates indicate that fuelwood forms a major part (58%) of the collections made from CPRs Fodder accounts for 25% and the category ‘other’ 17%. The predominant share of fuelwood in the total value of collections is a common feature in all the AC zones, except UG and TG. In these two agriculturally developed zones, the shares of fodder were more than 50%. A relatively high share of fodder in the total value of collections (39%) was also observed in two other A-C zones, viz. WHm and MG. The category ‘other’ accounted for a significant part of the collections in the A-C zones LG (47%), EHm (39%), WC (38%) and EHg(31%).

4.4.12 The survey results presented in Tables T9 and T10 reveal certain characteristic features of the A-C zones, which can be summarised as follows:

agro-climatic zones	characteristic features relating to use and availability of CPRs
1 WHm & EHg	A large majority of the population, in these two zones, reside within close proximity of forest. Very high percentages of households are engaged in collection activity. The average value of collections (Rs1,939) in WHm is higher than that in all other zones. It is also relatively high in EHg. In both these zones, fuelwood has a very high share in the total value of collections. Of the other two broad categories of materials collected, fodder is seen to be the important component in WHm and category ‘other’ in EHg.

agro-climatic zones	characteristic features relating to use and availability of CPRs
2. CHg & GC	About 80% households of these two zones reside in villages having 0.10 ha of CPR land per household or a forest within reach of the villagers. But neither the average value of collections nor the level of participation in collection activity can be said to be appreciably high. In both these States, fuelwood accounts for 60% of the total value of collections.
3. TD	Like CHg & GC, in this zone 0.10 ha of CPR land per household or forest is accessible to 80% of the households. But the CPR land in this rainfall deficient zone comprise desert areas and large tracts of barren and marginal land. Thus, both the average value of collection per household and percentage of households reporting collection are found to be the lowest among all the zone.
4. LG, MG, TG, EG & WC	In these Gangetic and coastal zones with moderate to low accessibility to CPR land or forest, both the average value of collection per household and percentage of households reporting collection are relatively low. Only in the A-C zone EG, the percentage of households reporting collection from CPRs was a little over the average for the country as a whole. Besides fuelwood, which formed an important constituent of the collections from the CPRs in all these zones, large part in the total value of collections accrued from fodder collection in A-C zones MG and TG, and collections of materials in the group "other" in A-C zones WC and LG.
5. DP & WHg	These two A-C zones have moderately high percentage of households residing in villages either with a forest within the reach of the villagers or 0.10 ha of CPR alnd per household. In these two zones, a large majority of the households was engaged in collection from CPRs, but the average value of collections per household was smaller than national average. Fuelwood was the important component of the collections from CPRs
6. EHm	The percentage of households residing in villages with a forest within the reach of the villagers or 0.10 ha of CPR land per household is close to the national average in this zone, though it comprises the north-eastern hill States. The percentage of households reporting collection from CPRs was also close to the national average. But, the average value of collection per household is found to be the highest among all the zones, except Whm. Besides fuelwood, the group of materials 'other' forms a major constituent of the value of collections in this zone.
7. UG	This zone contains the two most agriculturally developed States, viz. Punjab and Haryana. The availability of CPR land or forests is naturally low in this zone. Like the other Gangetic zones, the percentage of households reporting collection from CPRs was much lower than the national average. But, what is important to note is that the average value of collections from CPRs in this zone was very high, next only to the A-C zone Whm. Significantly, fodder had a very large share (about 70%) in the total value of collections.

4.4.13 *Varying value of collections across category of households:* It is widely accepted that the rural poor depends substantially on the materials available from CPRs for their sustenance. In an attempt to examine this view, the survey results relating to use of CPRs are given separately for different categories of households. With this purpose, households were classified into five broad categories as follows:

1. rural labour households: households with the largest share of household income coming from wage paid manual labour
- 2 Other households with land possessed less than 0.20 ha
- 3 Other households with land possessed 0.20 ha to 0.50 ha
- 4 Other households with land possessed 0.50 ha to 1.00 ha
- 5 Other households with land possessed 1.00 ha or more.

4.3.14 Table T11 gives the average value of collections from CPR and its percentage distribution by broad category of materials for each category of households. On the whole, it is seen, the average value of collections of the rural households (Rs 777) was considered by higher than that of the other households (Rs 630). The table also reveals that, leaving aside the second category of households, i.e. other households possessing less than 0.20 ha of land, the average value declines as one moves from the first category i.e. rural labour households, to the fifth category - 'other households possessing 1.00 ha or more land. The second category of households includes all the households engaged in non-agricultural activities with little or no land as well as the households depending on agricultural activity carried out on small area of land. The category therefore, comprises households of varying levels of living, and thus stands out as an exception to the generally observed negative association between value of collection and level of living, so far as a category of households represents.

Table T11: Percentage distribution of value of collections from CPRs by broad category of materials

category of households	percentage distribution by material-category				value of collection per household (Rs)
	fuelwood	fodder	other	all	
rural labour	61	25	14	100	777
<i>others with land possessed</i>					
less than 0.20	47	21	32	100	588
0.20 - 0.50	57	27	16	100	749
0.50 - 1.00	53	29	18	100	679
1.00 or more	59	26	15	100	593
<i>others: all</i>	54	26	20	100	630
all households	58	25	17	100	693

4.3.15 The table also reveals that the share of fuelwood in the total value of collections, in general, decreases as one moves up from the first to fifth category of household. In this case too, the second category of households stands out as an exception.

#### **4.4 Fuelwood from CPRs**

4.4.1 Common property resources, as a major source of fuelwood supply to the villagers, play an important part in meeting the energy needs of the rural population. A large majority of the rural households still depends on bio-mass fuel, particularly fuelwood, for cooking and heating. The growing needs for fuelwood and the resulting depletion in the vegetative cover in the countryside have been causes for grave concern for quite some time now. But, as observed by the Planning Commission, there is no accurate data on the patterns of supply and consumption of energy in the rural areas. There is also no data to indicate the role CPRs play in this respect. The present enquiry is an attempt to provide estimates of fuelwood collection from the CPRs at the State- and national-level as well as for the Agro-climatic zones, as identified by the Planning Commission.

Table T12: Collection of fuelwood from CPRs and their sale

item	estimate
1. Percentage of households reporting use of fuelwood	62%
2. Percentage of households reporting collection of fuelwood from CPRs	45%
3. Percentage of households reporting sale of fuelwood collected from CPRs	1%
4. Average quantity of fuelwood collected during 365 days (kg)	500
5. Average quantity of fuelwood sold during 365 days (kg)	24

4.4.2 Table T12 gives the survey estimates relating to use of fuelwood and its collections from CPRs. It is seen that about 62% households use fuelwood in rural areas. This estimate is based on the responses to just one straight-forward question on use fuelwood asked to every surveyed household and represents the percentage of households using fuelwood obtained from any source. The estimates relating to collection and sale, on the other hand, are based on detailed information on quantity of fuelwood collected from various types of CPRs and their sales. The estimated percentage of households reporting collection of fuelwood from CPRs too is obtained from this data. The percentage of collecting households (45%) indicate the high level of dependence of the rural population on CPRs for meeting their energy needs. Sale of fuelwood collected from CPRs was found to be much less common.

4.4.3 The average quantity of fuelwood collected from CPRs during 365 days was estimated as 500 kg per household. This estimate alone does not indicate the level of dependence of the rural population on CPRs for meeting their needs for fuelwood. Measuring the level of dependence in quantitative terms requires an estimate of quantity of fuelwood consumed during 365 days. The present enquiry do not provide any such estimate. Thus, in an attempt to assess the level of dependence on CPRs, the estimate of collection is compared with the estimate of consumption of

fuelwood obtained from the Consumer Expenditure Survey of the 50th Round of the NSSO.<sup>4</sup> Table T13 gives these estimates.

TableT13: Estimates of consumption of firewood and chips obtained from NSS 50th Round, 1993-94

item	estimate
1. Percentage of households reporting use of fire & chips	87%
2. <i>Monthly per household consumption of firewood &amp; chips (kg):</i>	
cash purchase	10.67
home grown	27.61
total	84.55
3. Per household annual consumption of firewood & chips (kg)	1015
4. <i>Derived value of average quantity of fuelwood consumed out of collection during 365 days (kg)</i>	555
5. Percentage of consumption out of collections in total consumption	55%

4.4.4 In the consumption expenditure survey of the NSS 50th Round, data were collected on, among other things, quantity and value of firewood and chips consumed during 30 days preceding the date of survey and the parts thereof coming from 'home produce', i.e. household's own resources. Data on quantity and value of purchases of firewood and chips were also collected in the survey. The total quantity consumed is constituted of the quantity purchased, the quantity from home produce and the quantity collected free. Table T13 shows that average monthly consumption of firewood & chips per household is of the order of 85 kg, out of which about 11 kg are purchased and about 28 kg are obtained from household's own resources. Thus, it appears, the rest 46 kg of monthly consumption comes from collection, which amounts to 555 kg per year. That is, about 55% of the household's needs for firewood & chips were met from those collected free, most of which can be assumed to come from CPRs

4.4.5 The data of the consumption expenditure survey, however, do not provide estimates of consumption of fuelwood separately. It includes most other bio-mass fuels like crop residues, bagasse, other agricultural wastes and cow dung. The difference between the estimates of percentage of households using fuelwood from the two surveys clearly indicates that while estimate of the present survey pertains to use of fuelwood alone, that of the 50th Round also includes households reporting use of other bio-mass fuels as well. The estimates of quantity collected per household per annum from the two surveys — 500 kg from the present round and 555 kg from the 50th Round — however, are found to be broadly of the same order.

4.4.6 *Inter-State variation in use and collection of fuelwood:* Table T14 gives the survey estimates relating to use of fuelwood and collection from CPRs. It also gives the survey results relating to consumption of fuelwood and chips for comparison as well as to form an idea about the level of dependence of rural population on collections from CPRs for supply of fuelwood. It is seen

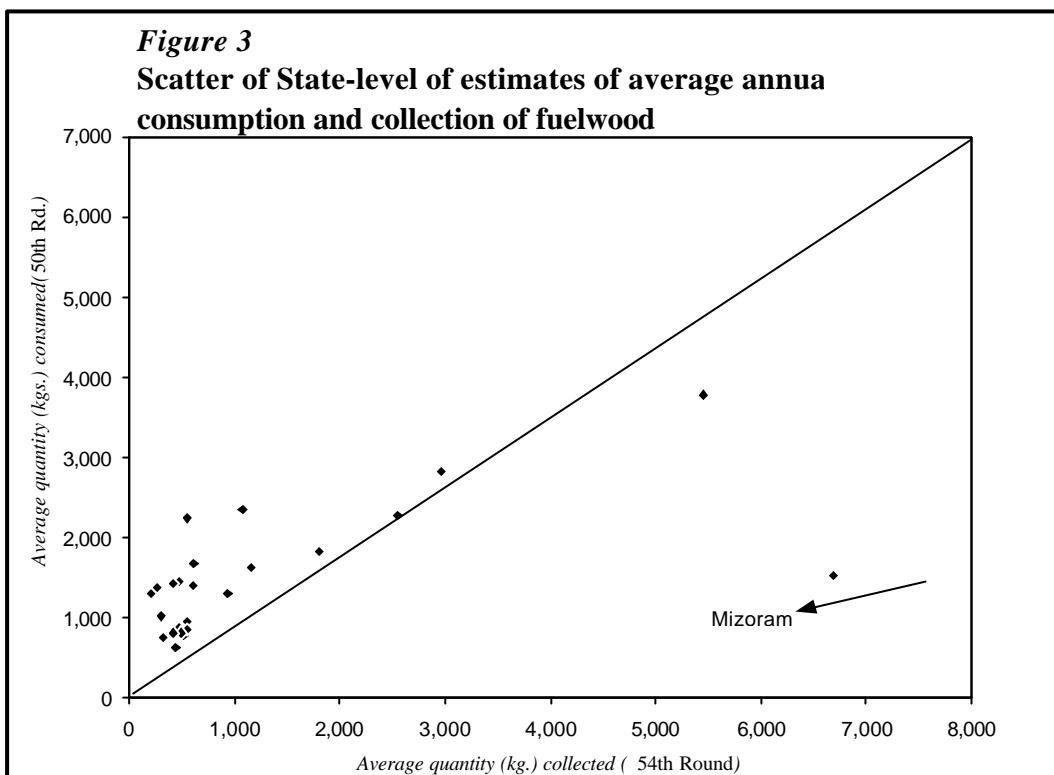

<sup>4</sup> See NSS Report no. 404: *Consumption of Some Important Commodities in India*, NSS 50th Round, 1993-94.

that the estimates of percentage of households using fuelwood from the present survey are in general much smaller than those from the 50th round for all the States. Moreover, there is no perceptible relationship between the two sets of estimates.

Table T14: Estimates of consumption and collection of fuelwood in different States

State	percentage of households using fuelwood		percentage of households reporting collection	average quantity collected (54th round.)	average quantity consumed (50th round.)
	54th round (1998)	50th round (1993-94)

Tripura	51	97	31	427	1417
Uttar Pradesh	51	88	33	416	813
West Bengal	51	73	38	324	742
India	62	87	45	500	1015

4.4.8 The average quantity of annual consumption from the 50th round and the average quantity of annual collection of fuelwood from the present survey for different States reveal a distinct positive relationship (*Figure 3*). The case of Mizoram, however, stands out as a notable exception. The ratio between quantity collected from CPRs and quantity consumed indicates the level of dependence on CPRs for supply of fuelwood. *Figure 3* indicates that the level of dependence varies little across the States, except in the four north-eastern States of Mizoram, Nagaland, Meghalaya and Arunachal Pradesh. In these States, the estimates indicate that all fuelwood that is collected is not consumed in the rural areas of the respective States. The very high value of average quantity of collection in Mizoram, however, suggests presence of some unusually high values of collection in the data of the present survey for this State.

**4.4.9 Inter-zone variation in use and collection of fuelwood:** Table T15 gives the survey estimates relating to use of fuelwood and collection from CPRs separately for the agro-climatic zones. Both the percentage of households using fuelwood and that of households collecting fuelwood were found to be relatively high in the A-C zones (refer Appendix III) WHm, EHg, DP, GC and Isl. On the other hand, the percentage of households using fuelwood as well as that of collecting fuelwood was relatively low in the A-C zones LG, MG and TD. In addition to these, low percentages of households collecting fuelwood were also reported in the A-C zones WC, TG and UG as well. The estimates of per household quantity of annual collection of fuelwood from CPRs, given in the table, show a wide variation across the A-C zones. The three highest averages were reported in the A-C zones WHm (1203 kg), EHm (911 kg) and EHg (848 kg). The average was lowest for the A-C zone TD. Relatively low averages were also reported in the three Gangetic zones LG (260 kg), MG (338 kg) and TG (283 kg).

**4.4.10** The experiences of the Integrated Rural Energy Planning Programme (IREP) reveal that the non-commercial sources of energy contribute more than 90% of the total energy consumption for cooking in the rural areas of all the A-C zones, except EG and the Gangetic A-C zones. Based on the data on consumption of fuelwood in the 250 blocks covered under this programme in the VIIth Plan, average per capita annual consumption of fuelwood was estimated for each of the A-C zones. Table T16 gives the estimates of per capita annual consumption of fuelwood obtained from IREP as well as those obtained from the present survey. It shows that for the three zones WHm, EHm and EHg where the per capita collection was estimated to be very high, the per capita consumption too was estimated to be high in the IREP. However, though the per capita consumption was estimated

relatively high in the zones WC and TD, the per capita collection in these two zones was estimated to be quite low.

**4.4.11 Use of fuelwood and its collection form CPRs by population-size of villages:** To examine whether level of development of a village is an underlying factor determining the extent of use and collection of fuelwood, the estimates of percentage of households reporting use and those reporting collection are given in Table T17 by size-class of population of the villages, which is known to be a good proxy for the level of development of a village. The estimates clearly reveal that the smaller the population of a village the more extensive is the use as well as collection of fuelwood. This indicates that dependence on fuelwood as a source of energy tends to be higher in less populated villages.

Table T17: Use of fuelwood and collection of fuelwood from CPRs by population size-class of villages

## 4.5 Fodder from CPR

**4.5.1 Dependence on CPR for livestock rearing:** It is observed from the estimates given in Table T18, that rural India depends significantly for livestock rearing on CPRs viz., village forests, common grazing land, village site and threshing floor, barren or waste land etc. At the all-India level, while 56% of rural households reported possession of livestock, 20% of the households depended on CPR land for grazing of livestock, 13% of the households collected fodder from CPRs and only a small percentage (2%) of households reported cultivation of fodder on CPR land.

Table T18: Dependence on CPR for livestock rearing

item	estimates

West Bengal	54	17	31	9	55	22	1
India	56	20	35	13	275	38	63

T21), category of households (Table T20), population size class of villages (Table T22) etc., in terms of percentage of households possessing livestock, accessibility of CPR lands and forest for rearing the livestock with respect to grazing of livestock and collection of fodder, and average quantity of fodder collected from the CPR. And as expected, marked variation also is observed among the category of households and size-classes of the village and with respect to dependence on CPRs for rearing of livestock.

4.5.3 *Inter-State Variation:* Table T19 gives the State-level estimates of important parameters indicating the extent of use of CPRs for rearing livestock along with the percentage of households possessing livestock. It is observed from the table that same States are highly dependent on CPRs

for rearing of livestock, in terms of collection of fodder and grazing of livestock on CPR land. States like Rajasthan(84%), Himachal Pradesh(81%),, Uttar Pradesh(72%), Madhya Pradesh(68%) and Orissa(58%) reported relatively high percentages (all above the national average of 56%) of possession of livestock. High percentages of households of these States reported use of CPR land for grazing of livestock (34%, 43%, 30%, 62%, 60%). Besides, reported percentages of households possessing livestock in Haryana, Himachal Pradesh, Sikkim and Uttar Pradesh are quite high and relatively high percentages of households (26%, 36%, 33%, 23% respectively) reported collection of fodder from CPR land. Average quantity of fodder collection is also very high in these States. Haryana and Sikkim reported yearly collection of 1743 kg, 1401 kg of fodder respectively indicating dependence on CPR for rearing of livestock. Interestingly, in Punjab, though collection of fodder from CPR is quite high (1095 kg), grazing on CPR land is lowest; only 1% households reported grazing of livestock on CPR land and 18% households reported collection of fodder from CPR land.

4.5.4 On the other hand, in States of the north-eastern region, viz., Meghalaya, Mizoram, Nagaland and Tripura, a majority of households (92%,100%, 65% and 69%, respectively) have access to CPR land under forest but are not greatly dependent on CPRs for grazing of livestock or for collection of fodder. Moreover, except for Nagaland where 86% of households reported possession of livestock, percentages of livestock-possessing households in these States are low. Accessibility to CPR land thus does not imply a high degree of dependence on CPRs for rearing of livestock.

Table T20: Use of CPRs for livestock rearing by category of households

category of households	percentage possessing livestock	percentage reporting collection of fodder	Avg. quantity of fodder collected (kg)
rural labour	42	13	294
<i>other with land possessed (ha)</i>			
less than 0.20	25	8	200
0.20 - 0.50	66	17	305
0.50 - 1.00	80	18	338
1.00 – more	88	11	251
<i>other: all</i>	66	12	261
All	56	13	275

4.5.5 In case of Arunachal Pradesh and Orissa, in spite of high accessibility to forest area, collection of fodder reported is unexpectedly low in terms of quantity collected and number of households collecting fodder. In Haryana and Punjab accessibility to forest and non-forest area is not significant, only 35% and 10% of households reported accessibility to CPRs but both the States reported high value in terms of average quantity of fodder collected.

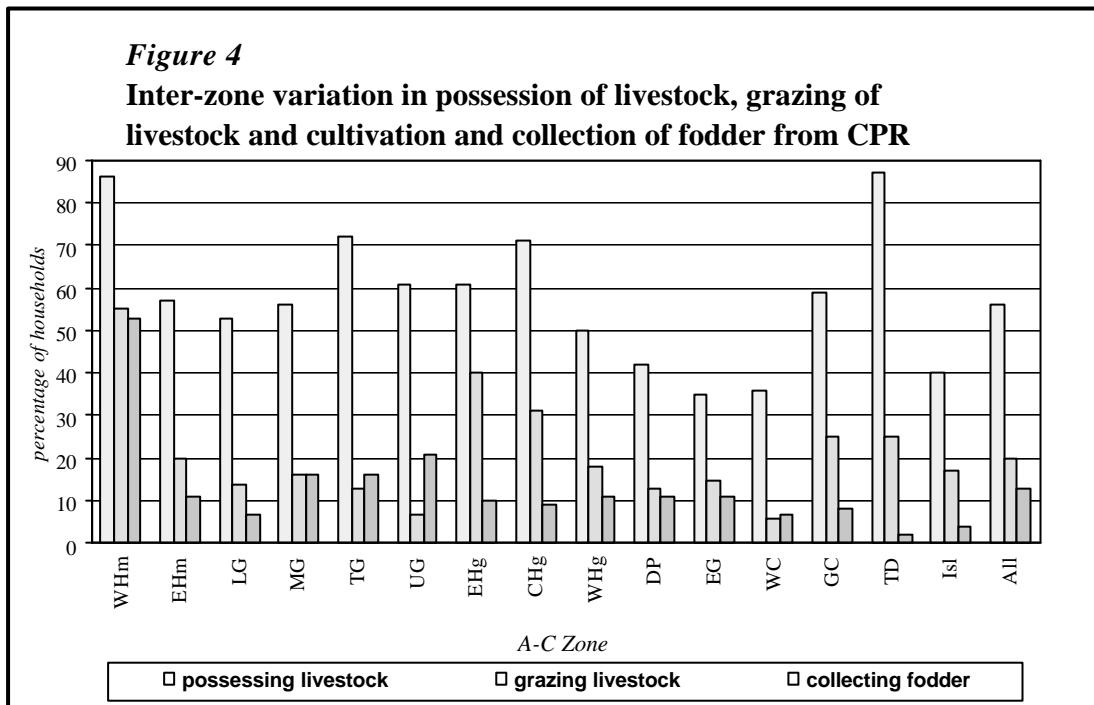

Table T21: Use of CPRs for rearing of livestock in different A.C. zones

all Islands (Isl)	40	17	4	15	88	-
India	56	20	13	275	38	16

**4.5.6 Variation in possession of livestock and collection of fodder by category of households:**  
 Table T20 gives percentages of households possessing livestock and reporting collection of fodder, and average quantity of fodder collected for each category of households. The table reveals that the households possessing less than 0.20 ha land are the lowest placed in terms of possession of livestock (25%), collection of fodder (8%), and average quantity of fodder collected per household (200 kg) from CPRs. For all other categories of households, percentage of households reporting possession of livestock increases steadily with the increase in possession of land and the same kind of relation is found in case of percentage of households reporting collection of fodder from CPRs and average quantity of fodder collected from CPRs.

**4.5.7** But the fifth category of households (possessing 1.00 ha or more land) is an exception, where both the percentage of households (66%) and average quantity of fodder collected from CPRs is relatively low (251 kg). This indicates that large land owning households do not greatly depend on CPR for rearing of livestock. But in general possession of livestock is positively associated with possession of land. (It is already observed that rural poor depends to a large extent on the materials available from CPRs for their subsistence).

**4.5.8 Inter-zone variation:** Table T21 gives for different agro-climatic zones, the percentages of households possessing livestock, reporting grazing of livestock on CPR land, and collection of fodder from CPRs, access to forest, and households residing in villages having 0.1 ha or more of CPR land per household. It also provides the estimates of average quantity of fodder collected from CPR land per household. Wide variation observed across the A-C zones in respect of all these parameters is discussed here.

**4.5.9** Except for the A-C zone WHm, EHg, and CHg, where dependence on CPRs is notably high, in terms of utilisation of CPR land for grazing of livestock and accessibility to CPR, rearing of livestock is not entirely dependent on the availability of CPR land in general. In these three regions respectively 86%, 61% and 71% of households reported possession of livestock, 55%, 40% and 31% of the households reported grazing of livestock on CPR land and 83%, 70% and 53% reported accessibility to CPR land. Even within these three regions, a marked difference exists in respect of percentages of households collecting fodder from CPRs and the quantity of fodder collected. In WHm, 53% of households reported collection of fodder from CPRs, in EHg only 10% and in CHg, 9% of households were involved in such activity.

**4.5.10** In the A-C zones EHm, LG, MG, TG and UG, high concentration of CPR land other than forest is found where percentage of households possessing livestock is high, but percentage of households collecting fodder from CPRs and utilisation of CPRs for grazing of livestock is below the national average with the exception of UG. In case of UG, which is a highly developed agricultural region, average quantity of fodder collected from CPR is exceptionally high(1343 kg), almost 5 times the national average but accessibility to forest area or households residing in villages with 0.10 ha or

more CPR land is remarkably low, which indicates that except for collection of fodder no other aspect of livestock rearing is greatly dependend on the CPRs In spite of concentration of non-forest CPR land observed in the regions WHg, DP, E.G., WC, GC and TD, where the percentages of households possessing livestock are relatively high, the percentages of households reporting grazing and collection of fodder from the CPR are relatively low. In general, dependence of rearing of livestock on CPRs is not very pronounced across regions.

Table T22: Use of CPRs for livestock rearing by population size class of villages

population size-class	percentage of households reporting		
	Possession of live-Stock	grazing of live-stock	collection of fodder
less than 100	82	73	60
100 - 200	72	42	23
201 - 600	70	29	15
601 - 1200	64	26	14
1201 - 2000	58	20	12
2001 - 5000	50	14	12
5001 & above	37	10	9
all	56	20	13

**4.5.11 Variation in use of CPR for livestock rearing across size-class of villages:** Table T22 reveals a close relationship between the population size-class of villages and their dependence on CPRs for rearing of livestock. It is seen that in the smallest size-class (population size less than 100) the percentages of households reporting possession of livestock (82%), collection of fodder from CPR land (73%) and used CPR land for grazing of livestock (60%) were higher than those for all the other size-classes. The corresponding percentages were only 37%, 10% and 9% of the households in the highest size-class. This trend indicates indispensability of CPR for subsistence and accessibility of CPR in the thinly populated areas of the country at large.

**4.5.12 Grazing in CPR land, forests and other land in different agro-climatic zone:** The estimates given in Table T23 reveal that utilisation of CPR land as well as forests for rearing livestock is more pronounced for the A-C zones WHm, EHg and CHg where 55%, 40% and 31% of households respectively reported grazing on CPR land or village forest or govt. forest. And the role of village forest for rearing of livestock in the country is not at all vital except for the A-C zone EHg where 10% of the households reported dependence on village forest for rearing. At the all-India level, only 2% of the households reported use of village forest for this purpose. In fact EHg is the only A-C zone where a uniform distribution of households for grazing of livestock over the type of CPR lands was found. And WHm is the only A-C zone where govt. forest was found to be of great importance in respect of rearing of livestock . In this A-C zone 45% of the households reported grazing of livestock on govt. forest but only 3% reported use of village forest for this purpose.

Table T23: Percentages of households reporting grazing of livestock on different types of CPR land and forests

## 4.6 Common Property Water Resources

4.6.1 Typically an Indian village has a number of water sources of different types, which are used by the villagers for a variety of purposes. Besides meeting the domestic needs, such as drinking, cooking, washing etc., the sources are used for irrigation, feeding and washing livestock, fishing and for other household enterprises. Many of these are privately owned, while the rest are usually meant for community use. The sources belonging to the latter category are either held by the village community as a whole or a caste- or religion- or occupation-based community or a community on the traditional social order or community of persons residing in a geographical location. There are also sources of water which are either constructed by or lie within the jurisdiction of a government department. All such sources, whether or not under the control of a community or a local body of the village, but not held by individual households, were treated a common water resources.

4.6.2 It is important to note that for collection of data on availability of common property water resources (CPWRs) only the common water resources were considered. But, for collection of data on use, a broader definition of CPWRs was adopted. By this definition, all privately owned water resources which were used as common property by the villagers were also treated as CPWRs. The estimates of the present survey, however, suffer from a serious limitation in this respect. Privately owned water resources were to be considered as CPWRs only when the resources were available

for use of the villagers free of cost. Thus, the cases of use of water resources of ‘other households’ reported in the survey represent both kinds of use. Tables 26.1 & 26.2 of Appendix I give separate estimates of percentage of households using CPWRs for each type of ownership and management. In these tables, therefore, the estimates of households using water resources owned by ‘other households’ are given separately. For the other four tables on use of CPRs given in Appendix I, however, use of water resources owned by ‘other households’ was treated as use of CPWRs

Table T24: Percentage distribution of households by availability of community and government water resources in villages of their residence and presence of local management of CPRs

**4.6.3 Availability of CPWRs:** The CPWRs play an important resource-augmenting role in the private-property based farming involving production of crops, rearing of livestock, etc. To assess the availability of such resources, data on the number of tanks, ponds and lakes, which were not used mainly for domestic use and were within the boundary of the surveyed villages were collected in the survey. Data were also collected on presence of local management of CPWRs - either local self-government (like *panchayat*) or any functionally effective local-level system for managing CPWRs. The percentage distribution of households by availability of CPWRs given in Table T24 is based on these village-level data collected in the survey.

**4.6.4** All water resources under formal control of local organisations like cooperatives, *pani panchayats* or any other formal farmer’s association for their management were treated as community resources. This category also included the irrigation tanks and other tanks and ponds whose management was formally assigned to the village *panchayat*. ‘Government water resources’ in Table T24 include all tanks, ponds and lakes under the direct control of the Public Works

Department or Minor Irrigation Department and all those located on unassessed revenue land or land under forest department.

**4.6.5** Table T24 reveals that about 52% of the rural households in India resided in villages with at least one common source of water like ponds, tanks and lakes meant for non-domestic uses. It also shows that about 10% of the rural households resided in villages with some system of local management of CPWRs. Community water resources were available to about 38% of the households, and government water resources to 24%.

Table T25: Percentages of households reporting different use of water resources (other than self-owned) different agro-climatic zones

**4.6.6** Availability of CPWRs and presence of local management vary widely over the agro-climatic zones. The availability of common property water resources like ponds, tanks and lakes for non-domestic use were found to be the highest in the A-C zone 'East Coast Plains & Hills (EG). About 78% households of this zone resided in villages with at least one such resource. The availability was relatively high in the A-C zone Ehg (70%) and DP (68%) as well. Again presence of local management was found to be most common in the A-C zone EHg. In this zone, about 30% of the households resided in villages having local organisations for management of CPWRs. The percentage was relatively high in A-C zone DP(20%) and Ehg (10%).

**4.6.7 Non-domestic use of CPWRs:** The percentages of households reporting different kinds of use of water resources not owned by the surveyed households in Table T25 reflect the role of CPWRs in the economy of the rural population. About 30% and 23% of the households of rural

India were found to use these resources respectively for livestock rearing and irrigation. For each of the other activities, ‘other household enterprises’ and ‘fishing’, use of these resources was reported by only about 3% of the households.

Table T26: Number (per 1000) of households reporting use of water resources owned by different agencies for irrigation

All	133	37	11	8	18	116	103	359

\*tanks/well/tubewell

4.6.8 The two highest percentages of households using CPWRs for livestock rearing were reported for the A-C zones W<sub>Hm</sub>(70%) and TD(53%). It was relatively high in the A-C Zones CH<sub>g</sub>(44%) and EH<sub>g</sub>(43%) as well. As for use of CPWRs for irrigation, the percentages of households using CPWRs were estimated to be very high in the A-C zones TG(45%) and MG(44%). In the A-C zones W<sub>Hm</sub>(20%) and LG(25%) too, the percentage was relatively high. The high percentages of households using CPWRs for irrigation in the Gangetic A-C zones LG, MG and TG perhaps owe to high percentages of households using water resources of other households. Table T26 reveals that about 35% of the households were using water resources of other households in the A-C Zones MG and TG. In the A-C zone LG too, 14% of the households reported use of water resources belonging to other households. These estimates indicate the limitation mentioned in paragraph 4.6.2. In agriculturally developed A-C Zones like MG, TG and LG, where multi-cropping depends greatly on availability of irrigation, it is quite unlikely that water resources owned by one household can be used as common property by other households.

4.6.9 Table T26 shows that the percentage of households using water resources of ‘other households’ for irrigation was higher than 5% in all the Gangetic A-C Zones, CH<sub>g</sub> and GC. It appears that the estimates of percentage of households using water resources not owned by the

surveyed household for irrigation, given in Table T25, do not reflect the extent of use of CPWRs for irrigation in these A-C zones. Leaving these AC zones apart, it is seen from Table T25 that CPWRs played a very important role in irrigating land in the AC zone WHm. A number of traditional systems of diversion channels, like *Kuhls* in Jammu and Himachal Pradesh and Tehri-Garhwal region of Uttar Pradesh, is known to be prevalent in this A-C zone. Relatively low percentage of households residing in villages with community and government tanks, ponds and lakes (Table T24) together with relatively high percentage of households reporting use of CPWRs for irrigation(Table T25) suggests that the traditional stream and diversion channel based systems continue to be the major source of irrigation in this zone. Among the other A-C zones, relatively high use of CPWRs for irrigation was found in EG(18%), EHg(17%), DP(14%) and TD(13%).

Table T27: Percentages of households reporting use of water resources (other than self-owned) for irrigation and livestock rearing by category of households

category of households	for irrigation	for livestock rearing
rural labour	14	24
<i>other households possessing land:</i>		
less than 0.20	8	12
0.20 - 0.50	46	34
0.50 - 1.00	43	42
1.0 or more	33	47
<i>others: all*</i>	30	34
all households	23	30

\* *others: all* stands for households other than rural labour households

4.6.10 *Use of CPWRs by different category of households:* Table T27 gives the percentage of households reporting use of water resources not owned by them for irrigation and livestock rearing separately for each category of households. Both for irrigation and livestock rearing, it is seen, percentages of rural labour households using such water resources were much smaller than those of the category ‘other households’. Within the category ‘other households’, on the other hand, the higher land holding category, the lower was the percentage of households using water resources not owned by them for irrigation and livestock rearing.

# **Appendix I**

### **Delineation of Agroclimatic Zones**

## **A Note on Delineation of Agro climatic Zones for presentation of results of the survey on Common Property Resources, NSS 54th Round**

In order to study rural economy of the country the Planning Commission (P.C.) has delineated 15-Agroclimatic zones in the country primarily based on soil, climatic condition and availability of water resources so that each may be considered as a single homogenous spatial unit for agricultural growth and development. In recent years, a large number of case studies and medium- scale surveys on Common Property Resources (CPR) have been conducted by scholars. They have shown that availability and utilisation of CPR vary widely over the regions even within a state. From this perspective, estimates of various parameters relating to Common Property Resources obtained from the 54th Round of NSSO have been given separately for different agro climatic zones of the country. While delineating different agro climatic zones the P.C. has taken the district as the ultimate units forming a zone.

In the absence of complete information on the composition of different agro climatic zones in terms of the districts, NSSO had to identify on its own the districts belonging to different zones by blowing up a small map showing approximate boundaries of different zones available from a paper by H.G.Hanumappa, of Indian Institute of Social and Economic Change, Bangalore and matching it with latest available India-Administrative-1:6m map produced by National Atlas Thematic Mapping Organisation, Deptt. of Science and Technology, Govt. of India. The list of districts belonging to different agroclimatic zones was prepared. Some doubtful cases, mostly on the boundaries between the zones, were resolved by consulting NATMO's Soil, Climate, Drainage and Physiographic maps of the relevant area. Viz. Bilaspur, Mandla, Balaghat in MadhyaPradesh, Chandrapur, Raigarh, Ratnagiri, Sindhudurg, Nagpur, Bhandara in Maharashtra, Bankura, Purulia in West Bengal.

The composition of the regions, in terms of the list of districts belonging to respective agro-climatic region within a state are given in the following pages.

## The list of Agro climatic Zone

### **Editing and Imputation of Survey Data**

## **A Note on Editing and Imputation of Survey Data of the Enquiry on Common Property Resources(CPR), NSS 54<sup>th</sup> Round.**

---

As in all large-scale sample surveys, response and non-response errors are present in the data of surveys conducted by the NSSO. Errors of other kinds like coverage errors and data processing errors, which occur even in the best of surveys, are also common in NSSO survey data. Usually, certain measures are taken to eliminate or at least control these errors either at the data-collection phase or during data processing. This note gives a brief account of the steps taken to edit the errors during the processing of survey data of the enquiry on Common Property Resources conducted in the 54<sup>th</sup> Round of NSSO.

In the NSSO, the data collection and subsequent data processing are carried out in two separate divisions of the organisation. While the Field Operations Division (FOD) conducts the data collection through its field staff, the Data Processing Division (DPD) performs all the data processing operations. A field investigator of the FOD visits a sampled unit, interviews a person who is available for providing the necessary information, and records the responses in the schedule of enquiry meant for the survey. The essential information is invariably recorded in the numeric form - code numbers for categorical data, and values in prescribed units for quantitative data. After examination by supervisory staff, completed schedules of enquiry are despatched to a center of the DPD.

The completed schedules received by the DPD are first examined manually, particularly for coverage and documentation. At the same time, a pre-data-entry edit, aimed at eliminating gross errors and inconsistencies, is carried out on each schedule. The editing at this stage is generally based on a small set of rules, meant primarily for spotting and correcting the data not recorded in the prescribed unit or format. The schedules of enquiry, thus edited, are then sent for data entry on computers.

Like all large survey organisations, the NSSO has developed a computer-aided system of editing survey data. This is carried out in two phases. In the first phase a series of edit checks embodied in a computer program are run on the data loaded on the computer to identify inconsistencies, i.e. logically impossible values in the data, suspect data or outlying values, and item non-response cases, i.e. essential items left blank in a (partly) filled-in schedule. This edit program, called Computer Scrutiny Program (CSP), produces a list of errors which is sent to the scrutiny sections for editing inconsistent data. The scrutinisers trace out the corresponding schedules, manually compare the computer-entered data with responses recorded in the schedules, and make corrections on the error lists whenever required. The main data file in the computer is accordingly updated. Besides the CSP, often a special program consisting of a very limited number of checks is run on the data to spot “too high” or “too low” value of an item or ratio (implicit price, for example) of two items. The main data file is similarly updated for the resulting corrections.

Though the first phase of computer-aided editing is supposed to remove all data-entry errors, the inconsistencies, a few suspect large values and item non-responses continue to persist in the data file. The second phase of computer-aided editing becomes necessary for removing these errors, to the extent possible. This is a mechanical procedure that eliminates inconsistencies, corrects suspect values and

*Report No. 452: Common Property Resources in India, Jan - June 1998, NSS 54<sup>th</sup> Round*

generates imputed values for non-response items. Usually, the set of rules constituting the procedure of computerised editing are framed with a great deal of care after critical examination of a large volume of data.

### **Computerised Editing**

The essential features of computerised editing for the enquiry on Common Property Resources as well as the frequency of each type of error is discussed below in some detail. This will give a fair idea of the magnitude and direction of possible biases in the estimates presented in this report. Two schedules of enquiry were used for data collection on CPRs in the survey. Broadly speaking, one was meant for collection of information on availability of different kinds of CPRs and was canvassed for each village in the sample(Sch.3.3). The other schedule (Sch. 31) was canvassed in for each households in the sample. A part of this schedule was meant for recording information on utilisation of the CPRs by the households. Editing procedures for these schedules are discussed in the sections **I** and **II**.

#### **I. Editing Procedure for Schedule 31**

This part of the data collected in the 54<sup>th</sup> Round of NSSO relates to utilisation of land and water resources and the type of resources i.e. whether the resources belonged to village common land, village forest, govt. revenue land /canal/river/springs, well, tubewell etc. Along with these, information was also collected on type of items collected from CPR, in respect of their quantity and value, and purpose of their collection i.e. whether those items were collected for household consumption, sale, or for household enterprise.

##### **A. Use of land resources in the last 365 days**

Information was collected on utilisation of land resources like own land, village common panchayat, village forest, govt. revenue land, land of other households, river/tank bed in respect of

- (a) i) cultivation of fodder and other crops  
ii ) grazing of livestock
- (b) collection of the following items
  - i ) manure
  - ii) fruits, roots, etc.
  - iii) honey
  - iv) medicinal herbs etc.
  - v) leaves
  - vi) weeds, grass, canes etc.

For these items, responses were recorded in terms of their use in codes viz., ‘home consumption’-1, ‘sale’-2, ‘household enterprise’-3, and ‘blank’. Item wise edit points are discussed below. The large numbers of inconsistencies in the following cases occurred mainly due

introduction of a certain procedure adopted at the data entry stage and subsequent processing. Initially a code '9' was entered in place of blanks which represented, according to the instructions given to field staff, household's response 'not used/collected'. This procedure was followed only for the first part of the data entry operation. Subsequently it was decided to leave the blanks as they were. There during the computer editing stage all the '9' entries were converted back to 'blanks', thus giving rise to so large a number of inconsistency.

**I. Cultivation of fodder:** Any response code other than 'sale' or 'household enterprise' or 'blank', for this item was treated as invalid. All such entries were edited in the following way:

- (a) if the entry was 'home consumption', it was edited as 'household enterprise' i.e., for consumption of livestock only, since cultivation of fodder by households is mainly done for this purpose.
- (b) if entry for this item was inadmissible but the household reported cultivation of fodder as one of the major crop-group cultivated( in the part of the household schedule meant for recording data on cultivation practices) , such entry was edited as fodder cultivated for 'household enterprise' if possession of livestock was recorded for the household. In case possession of livestock was not recorded for the household, invalid entry was edited as household cultivated fodder for 'sale' only.
- (c) if entry for this item was inadmissible and also no information was available on cultivation of fodder under five major crop cultivated by the household, all inadmissible entries were made blank, since no other information was available in the data set to edit this type of inconsistencies.

In total 15681 inconsistent responses were found out of 96,685 cases of land-utilisation recorded. The largest number of discrepancies was found in Punjab(2,874) followed by Gujarat (2,595). Most of the inconsistencies occurred due to wrong entry of the for 'home consumption' rather than that for 'household enterprise'.

**II. Cultivation of other crop:** There were 10,618 cases where recorded entries were recorded outside the range specified codes. All such inadmissible entries were edited on the basis of the information available on the major crop-group cultivated in the part of the schedule meant for the enquiry on cultivation practices by the same set of households. In case of the households reported cultivation of at least one major crop specified for (the purpose of ) the survey, inadmissible entries were edited as crop cultivated for 'home consumption', otherwise inadmissible entries were made blank. The four largest number of inconsistencies were observed in Punjab(2,722) Gujarat (2,452), Orissa(2,066) and Andhra Pradesh(1,052).

**3. Grazing of livestock:** Inconsistency observed were of the following two types,

(a) response code recorded were other than 'household enterprise'. Quite a large number found in the data set where the entry was 'home consumption', (about 40% of the total responses for this item was recorded as 'home consumption' for Madhya Pradesh) which is the general tendency observed.

- (b) the response recorded was not consistent with the response recorded for the item ‘possession of livestock’.

In case of (a), all invalid entries were edited as ‘household enterprise’ if all such households reported possession of livestock, otherwise entries were made blank. In case of (b), where the households reported possession of livestock all invalid entries for grazing of livestock were made blank. Quite a large number of inconsistent cases was found for both type – 10,262 of type (a) and 9,906 of type (b) such inconsistent responses were found out of a total of 96,685 records containing data on land-utilisation.

#### *4. Land utilisation for collection of different items:*

For the following items (given in 1a and Table1b), responses were to be recorded in codes as ‘home consumption’, ‘sale’, ‘household enterprise’ or ‘blank’. Any entry other than the four specified codes mentioned was treated invalid. Since there was no supporting information available for all these items to categorise the invalid responses according to the specified codes, all such responses were made blank. Surprisingly the same set of states viz. Andhra Pradesh, Gujarat, Karnataka, Kerala, Orissa, Punjab have large number of invalid responses for each individual item.

1a. *Manure*: For this item also quite a large number of inconsistent entry found in the data. In 14,002 cases, out of a total 99,985 land-utilisation data, were not consistent. Here also the general tendency was to record response as ‘home consumption’ in the cases where the households reported use of manure even though the code specified was ‘household enterprise’. About 50% of the total responses for the item was recorded as ‘home consumption’ in case of Madhya Pradesh. High inconsistency observed in the data of quite a few number of states viz. Andhra Pradesh (1111), Gujarat(2342), Karnataka(1591), Kerala(1268), Maharashtra (1131), Orissa(2260), Punjab(2838). For all those responses recorded as ‘home consumption’, entries were edited as ‘household enterprise’, all other invalid/inadmissible entries were made blank.

1b. For the items mentioned in Table (1b) all the invalid entries were made blank for the reason mentioned earlier.

Table (1b)

Item	Total number of invalid responses	States showing high frequency of invalid entries
1. <i>Fruits roots etc.</i>	12071	Andhra Pradesh (1140), Gujarat(2163), Karnataka(1582), Kerala(1095), Maharastra(1051),Orissa(1973), Punjab(2839).
2. <i>Honey</i>	12399	Andhra Pradesh (1130), Gujarat(2172), Karnataka(1608),Kerala(1264), Maharastra(1051),Orissa(2124), Punjab(2829).
3. <i>Medicinal herbs</i>	12457	Andhra Pradesh (1138), Gujarat(2172), Karnataka(1643),Kerala(1264), Maharastra(1051),Orissa(2131), Punjab(2837).
4. <i>Leaves</i>	11969	Andhra Pradesh (1123), Gujarat(2147), Karnataka(1158),Kerala(1154), Maharastra(1046),Orissa(1884), Punjab(2833).
5. <i>Weeds</i>	12115	Andhra Pradesh (1102), Gujarat(2210), Karnataka(1453),Kerala(1157), Maharastra(1038),Orissa(2100), Punjab(2808).

## B. Utilisation of Water resources

For the following items , codes set were ‘1’ for use of the resource or ‘blank’ for not use. Any response code other than ‘1’ or blank was treated invalid. For all these items a large number of response code recorded as ‘9’ in place of blank which were subsequently converted back to ‘blank’ during computer editing , therefore rising to the number inconsistent cases . In total 72091 cases of use of water resources were found.

1. *Whether used for Irrigation:* Information on use of water resources for irrigation was collected through this item. Inconsistency in response for this item was checked on the basis of the information available on whether the same household irrigated any crop cultivated by the household. In the case of households reported irrigating at least a single crop, invalid entries was edited as ‘water resources used for irrigation’, otherwise such entries were made blank.. Not many inconsistency was observed for the item in the data set. In Madhya Pradesh no invalid record found for this item.

2. *Whether used for Livestock:* For this item consistency of responses recorded was checked on the basis of the information available on ‘possession’ of livestock by the same household. Invalid entries were edited as water resources ‘used’ for livestock, if the household reported possession of livestock otherwise such entries were made blank. Number of such invalid entry was very few, only 31 out of a total 72091 cases of use of water resources recorded.

### C. Average collection, consumption and sale of fuelwood and fodder

Information was collected on quantity and value of collection, consumption and sale of fuelwood and fodder during the 365 days as well during the 30 days preceding the date of survey. Inconsistency in data for these items occurred mostly due to missing quantity figures for given ‘value figures’ or missing ‘value’ figures for given quantity figures.

**1A. Quantity and value of collection, consumption, sale of fuelwood/fodder:** Out of the 99650 records containing data on these items, 1679 cases found to have monthly quantity value of either collection or consumption or sale of fuelwood/fodder were more than the corresponding yearly figures. Such inconsistent yearly figures were replaced by corresponding monthly figures to make the data consistent.

**1B. Quantity and value of collection, consumption, sale of fuelwood/fodder** (imputation of missing figure) : Each of the records containing data relating to fuelwood/fodder collected from CPRs had provisions for three pairs of quantity and value figures - one each for collection, consumption and sale. Out of these 99,650 records, missing figures of quantity or value were found in 38,938 cases for the item ‘fuelwood’ and 20,502 cases for the item ‘fodder’. All missing figures, both for quantity and values were edited by imputing them in the following manner :

- i) missing figures were imputed by using implicit price, i.e. value quantity, obtained from any other pair of the same record.
- ii) in case (i) failed, missing figure was imputed by using a sequential hot-deck method<sup>1</sup> within a region of a state with state-level average of implicit price as the initial value. The state-level average rates were computed from the rates falling within a predetermined range. The ranges were set after through examination of the available data. The range set for both fuelwood and fodder was: Rs.0.10 - Rs.5.00.

For the cases where the implicit price fall beyond this range, the following method was applied:

- a) if  $\text{Rs. } 0.10 > \text{value/quantity}$ , the quantity figure was replaced by a imputed figure obtained by either (i) or (ii)
- b) in case  $\text{Rs. } 5.00 < \text{value/quantity}$ , the value figure was replaced by a imputed figure obtained by either (i) or (ii).

---

<sup>1</sup> This is one of the most commonly used computer-aided techniques for imputation of missing values. This involves a single pass through the data file, arranged in a suitable order. When a missing value is detected during the run, the value of the valid entry for the item found last (i.e. the nearest preceding value) is substituted in the place of the missing value. The procedure requires an initial value (or a cold-deck value) at the start for each imputation class. Here a region of a state was taken as an imputation class and the data file was arranged according to the order of selection of both first stage and second stage units in the sample drawn systematically from same geographically arranged frame. An initial value of price for each individual item was determined on the basis of the average state-region-level rates as the initial value.

For the rest of the items the ranges set for imputing the missing figures are given in the Table (1) below.

Table (1)

Item	quantity/value range	Number of inconsistent records and type
1. Fruits	Rs.0.50 to 100.00	4916 inconsistent cases were spotted for this item Out of 4916 inconsistent cases 1047 cases were found where no 'sale quantity' was recorded for the corresponding 'sale value'.
2. Roots, tubers, spinach etc.	Rs. 0.10 to Rs.150.00.	864 inconsistent cases found
3. Quantity and value of collection and sale of gums and resins	Rs.4.00 to Rs.90.00	156 inconsistent cases found
4. Quantity and value of collection and sale of honey.	Rs.20.00 to Rs. 200.00.	938 cases observed
5. Quantity and value of collection and sale of herbs	Rs.3.00 to Rs.250.00.	1089 cases observed
6. Quantity and value of collection and sale of fish	Rs. 5.00 to Rs.350.00.	Out of a total of 17,478 cases reported for this item, quite a large number of inconsistent cases (7189) was found for this particular item. Inconsistencies were observed mainly in the data of north-eastern states. The largest number was found in Assam(1962), followed by Arunachal Pradesh(749), Mizoram(730), West-Bengal(578), and Bihar(550)
7. Quantity and value of collection and sale of leaves	Rs.0.06 to Rs. 55.00	2171 inconsistent cases found for this item
8. Quantity and value of collection and sale of weeds etc. This item includes weeds, grass, cane, bamboo etc.	Rs. 0.10 to Rs 50.00	2810 inconsistent cases found for this item

#### D. General information on uses of common land resources

Under this category, editing procedure for three important items, i) purpose of using fuelwood collected from CPR, ii) whether livestock was possessed by a household and iii) managing irrigation are discussed below:

1. *Purpose of fuelwood used for:* Six different response codes were set to record information on this item. Any other response code recorded were treated as invalid. Such inadmissible entries were edited as ‘fuelwood used for cooking only’ in case monthly or yearly consumption of fuelwood was reported for the same household in the data. Such inadmissible entries were observed in 1460 cases out of a total 78539 case recorded.

2. *Whether livestock was possessed by households during the last 365 days:* Responses allowed were classified in codes for ‘yes’(possessed)/ or ‘no’(not possessed). Any unspecified response code. For this item inconsistencies observed were of the following type :

i ) Entries recorded were other than ‘yes’ or ‘no’. All such inadmissible entries including blank were treated as invalid response and were edited on the basis of the information recorded for consumption of fodder. If a household reported consumption of fodder (yearly or monthly), inadmissible entry was edited as household ‘possessed livestock’. If no information was available on consumption of fodder entry was edited as household did ‘not possess livestock’.

ii) Apart from the inconsistency mentioned above, there were cases where the response recorded for the item was not consistent with other queries indicating possession of livestock, i.e., these are the cases where positive response for either *grazing of livestock* or *consumption of fodder* or *water resources used for livestock* was recorded, but entry for ‘possession of livestock’ was blank or inadmissible. These inconsistent cases were edited in the following way:

(a) For the cases households reporting consumption of fodder (yearly or monthly) or grazing of livestock or use of water resources for livestock but ‘possession of livestock’ code these households recorded were *invalid*, invalid entries were edited as household ‘possessing livestock’. And for other cases where such supporting information was not available the entry for this item was edited as household ‘not possessing livestock. 947 such cases found, out of 78539 households.

(b) Besides (a), there were cases where entry for the item was *household not possessing livestock*, but consumption of fodder (yearly or monthly) or both grazing of livestock and use of water resources for livestock were recorded. Since there was clear supporting evidence of household possessing livestock, all ‘not possessing ‘ cases were edited as household ‘possessing livestock’. In 1100 records such inconsistency was observed.

3. *Managing irrigation:* Information was collected on whether the household or any of its member was involved in managing irrigation tanks/ponds through a code ‘yes’ or ‘no’. 2569 inconsistent cases were found in the data set out of 78539 cases recorded, where the entries were blank or inadmissible. Since no other information was available in the data set in support of existence of ‘irrigation management’, all inadmissible entries were edited as ‘irrigation management did not exist’.

## II. Editing Procedure for Schedule 3.3

This part of the survey of the NSS 54<sup>th</sup> relates to Common Property Resources. In this part of the enquiry information was collected on particulars of common land in the village and nearby forest, right of use of such land and forests, particulars of common water resources in the village (excluding resources owned by households), particulars of collection from forest and other common village land through schedule 3.3. All information was collected entirely from the surveyed villages. Except for area, information on all other items were recorded in specified codes. Editing procedure for certain key items are discussed below.

### A. Common Village Land

1. *Area of de jure and de facto CPR land:* Information was collected on area of CPR land (both de jure and de facto lands) of four different types:

- (i) grazing/pasture land
- (ii) village forest and woodlot and van panchayat forest
- (iii) village site and threshing floors
- (iv) other barren or waste land not owned by any individual,

as well as the total CPR land as the sum of all the four component.

But there were sample villages for which the four components recorded did not add up to the recorded sum. In such cases entry for total land was replaced by the computed sum of the four recorded components unless this sum was zero.. Out of a total of 4939 cases of use of common land recorded, 2283 such inconsistencies were cases were found. Apart from errors in addition, these included, as far as could be made out, cases of decimal shift and transcription error during updation.

Besides this specific type of inconsistency, CPR area reported was occasionally also not consistent with area figures reported in the Primary Census Abstract (PCA) and the Village Directory (VD).

(i) 62 cases were found where CPR area recorded was more than the geographical area. All 62 cases were manually checked from the schedules, compared with the geographical area given in the PCA. But, unfortunately inconsistencies found even in the Census data where the geographical given was found to be less than the area under non-agricultural use given in the VD. Therefore no attempt was made to edit the survey data relating to area on the basis of the Census data. Very high figures of CPR area were kept as it was. Two villages in Rajasthan were reported to have more than 10,000 sq. km of CPR land, of which one was found to have a geographical area of about 69,000 sq. km according to the PCA. Therefore estimates based on area figures can be taken as a broad indicator. In all 715 cases found where either total village CPR area was more than total geographical area or total forest area was more than forest area given in the VD, or total of CPR area and forest area was more than geographical area. Such discrepancies were found mostly in Rajasthan and Gujarat.

(ii) There were cases where area of CPR forest recorded were same as that of govt. forest, giving rise to duplication.

2. *Right of use*: The same block of the schedule recorded, for each type of common land five types of right of use codes for de jure areas. These codes were categorised as (i) no right of community use on any part (ii) some area for community use (iii) reserved for a particular community or managed and owned by a tribal community (iv) partly reserved for certain /communities (v) entirely for all villages. As such the number of invalid ‘right of use’ entries was very few. But 3966 cases were found, where valid ‘right of use’ codes were recorded, but information on *de jure* area against such entries were blank. Such inconsistent data were edited on the basis of the information available on corresponding *de facto* area. Where right of use code recorded were within the admissible range and *de facto* area was recorded, the missing *de jure* area was assumed equal to the *de facto* area

3. *Leasing-out of CPR and area leased out*: (a) In case leasing out of CPR land was reported, it was checked whether such area reported exceeded the total CPR land recorded. If so, the leased-out area figure was replaced with max.(*de jure* cpr, *de facto* cpr) area and the corresponding area for total common land were also replaced with max.(*de jure* cpr, *de facto* cpr) area. Out of a total 4939 cases of use of village common land and forest recorded, only 176 cases found where such inconsistencies observed. It may be noted that only *de jure* CPR land was considered for leasing out, but since there seems to have existed confusion in this regard, the condition involves *de facto* as well as *de jure* CPR. In Madhya Pradesh and West Bengal, the number of records with *de jure* area < area leased out is 13, but in 6 of these cases it is seen that the area leased out is less than *de facto* area.

(b) where no leased-out area was recorded, the response code for “leasing out of CPR land”, if inconsistent with this information (that is , the code for ‘leased out’ being recorded) was edited appropriately to ensure consistency. There were very few cases of this type.

4. *Was the CPR land any larger and had the area diminished*: For the sampled villages reported existence of *de jure* land, information was collected in codes on whether the area of the CPR land was more 5 years ago than what it was on the date of survey and in case reduction in size of CPR land was reported, area of such diminished land was also recorded. Out of total 4939 cases of use of CPR and forest land recorded, 33 inconsistent cases found in the data where *area diminished* was recorded but code for ‘whether diminished’ was not appropriate. All 33 entries were edited as ‘CPR land was larger 5 years ago’.

## B. Forest (under Forest/Revenue Deptt.) within the village and right of use

Under this category information was collected on reserved/protected/unclassed forest land including civil/revenue/soyam/forest etc., along with their right of use, whether such forest were managed by local

bodies like JFM, Van Panchayat etc. Information was also collected on forest outside the village and within the reach of the villagers, its distance from the village as well as the legal status.

*Forest area:* Information was collected on area of forest under forest/revenue deptt. of three different types

- (i) Reserved Forest
- (ii) Protected Forest
- (iii) Unclassed Forest

as well as the sum of the three component as the total forest area of the village.

But there were sample villages for which the three components recorded did not add up to the recorded sum. In such cases entry for total forest area was replaced by the computed sum of the three recorded components unless this sum was zero. In case none of the three forest lands were recorded but only the total forest area was recorded, no editing was done, since no information was available in the data set to support categorising the forest land. Only in 491 cases such inconsistencies were found.

2. *Right of use:* Four types of response codes were set to collect information on right of forest area. These codes were categorised as ‘no right of use’, right of use for ‘collection of a large number of forest produce’, ‘of minor forest produce’, ‘restrictive use’. Any other response code recorded was treated invalid. Since no other information was available in the data set to support categorising right of use of forest, all invalid right of use code was made blank.

Beside this, there were cases where the right of use code was within the admissible range but no forest area was recorded. In such cases also right of use code were made blank.

129 inconsistent cases were observed out of a total of 4939 cases recorded on use of village common land and forest.

3. *Forest outside the village, its distance and legal status:* Except for the distance of the forest information on legal status of forests outside the village and their accessibility were recorded in specified codes. Inconsistency observed primarily in case of ‘legal status’ of a forest where the ‘status’ codes recorded were inadmissible. All inadmissible codes were made blank, since there were no other information available in the data set to assign any particular legal status to a forest.

4. *Collection from forest and other common village land:* Three different codes, ‘collected by majority of the households-1’, ‘by majority of the households-2’ and ‘none-3’ were set to record information on different material collected from forest and village commons. Entry recorded in unspecified code was treated

invalid. Out of total 4625 cases of reporting collection of materials from village commons and forest, 350 cases were invalid. All such invalid entries were made blank.

### C. Common Water Resources

Under this category information was collected on water resources in the village(excluding resources owned by households) viz.

- (i) community tubewell/well/tanks or ponds exclusively for potable water
- (ii) tanks, ponds and lakes managed by village panchyat/community
- (iii) tanks, ponds and lakes under irrigation department and other Govt. department
- (iv) whether water was drawn from river\spring\Govt. canal
- (v) whether common water sources were managed by local bodies for irrigation and other uses
- (iv) whether exclusive source for potable water exists for a community.

Consistency checks were done on the following items:

1. *Local body managing irrigation:* Only 58 inconsistent cases observed out of a total of 4982 cases reporting use of common water resources. For these 58 cases existence of management of irrigation by a local body was reported but no information was available on the existence of *common water resources* managed either by village panchayat or community or by irrigation department or by other govt. department or of river/spring/govt.canal where from water was drawn by the villagers. All such inconsistent data were made blank since no other information was available in the data set to support existence of local body for managing irrigation for such cases.
2. *Local body managing other uses:* No inconsistency observed for this item.
