

Report No. 410/2

# **energy used by indian households**

**NSS 50TH ROUND**  
**July 1993 - June 1994**

## **FIFTH quinquennial survey ON CONSUMER EXPENDITURE**

*National Sample Survey Organisation*

*Department of Statistics*

*Government of India*

*March 1997*

# PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all-India surveys on Consumer Expenditure since its inception in 1950 in almost all the rounds of NSS, barring a few, till 26th round (1971-'72) sometimes independently and sometimes integrating it with enquiries on other subjects in both urban and rural areas. At the instance of the Governing Council of NSSO, the survey on consumer expenditure was being conducted quinquennially since 1972-73 (27th NSS round). In order to have an idea about the short-term changes in consumer expenditure patterns, the NSSO began collecting data in its annual rounds also from the 42nd round (1986-87) onwards.

2. The fifth quinquennial survey on consumer expenditure was undertaken in the 50th round (July 1993-June 1994). A summary report giving household consumer expenditure patterns for all-India & for major states was brought out in March 1996. A second report giving detailed tables for each state & UT of the Indian Union on monthly per capita expenditure class by commodity groups, etc., have been brought out in May 1996. The third report in the series which deals with some aspects of nutritional intake by the Indian population, has been brought out in October 1996.

3. The present report deals with particulars of energy used by the Indian households. The report contains detailed tables on the different aspects of the primary source of energy used for cooking and lighting by the Indian households for each state and UT. According to NSS practice, all information has been classified by average monthly per capita expenditure (MPCE) classes, a format which has in the past proved extremely helpful to the users and researchers in various areas. Observed trends by some important indicators of various energy used by the households over the decade (1983 to 1993-94) have also been presented.

4. Chapter one of the report is introductory, while chapter two contains a note on the Sample Design and Estimation Procedure followed in the survey. Chapter three briefly elaborates the important concepts and definitions and the survey findings are examined in Chapter Four. Detailed statistical tables are also appended to the report.

5. The schedule of enquiry for the survey was, more or less, similar to that adopted in previous quinquennial rounds. The field work for the survey was conducted, as usual, by the Field Operations Division (FOD) of the Organisation. The collected data were processed by the Data Processing Division (DPD) of the NSSO and tabulated by the Computer Centre of the Department of Statistics. The report has been prepared by the Survey Design & Research Division (SDRD) of the NSSO. I am grateful to the members of the Governing Council, Heads of various Divisions of the NSSO, the Executive Director, Computer Centre and their colleagues for the efforts taken in preparing the Report.

Comments/suggestions from the readers of the report will be most welcome.

March,1997  
New Delhi

P. R. Dongre  
Chief Executive Officer  
National Sample Survey Organisation

## List of Detailed Tables

---

<u>Table no.</u>	<u>Title</u>	<u>Page no.</u>
Table (1R)	Per 1000 distribution of households by primary source of energy for cooking for each MPCE class : statewise - Rural	A 1
Table (1U)	Per 1000 distribution of households by primary source of energy for cooking for each MPCE class : statewise - Urban	A 18
Table (2R)	Per 1000 distribution of households by primary source of energy for lighting for each MPCE class : statewise - Rural	A 35
Table (2U)	Per 1000 distribution of households by primary source of energy for lighting for each MPCE class : statewise - Urban	A 52

---

---

# **Highlights**

---

- ⇒ There has been an increase in the proportion of hhs using electricity as major source of lighting by 13% (from 24% to 37%) in rural & by 9% (from 72% to 83%) in urban India since 1987-88.
- ⇒ There has been a decrease in the percentage of households from 74% to 62% in rural & 27% to 16% in urban, since 1987-88, using Kerosene as primary source of energy for lighting. Still Kerosene remains the most important source of energy for lighting in the rural sector.
- ⇒ Firewood & chips continue to remain as the most important source of energy for cooking in the rural sector, 78.2% of the rural households depend upon it. Only one percent of households has switched over from this source since 1987-88.
- ⇒ Firewood/chips and Gas (coal, oil or LPG) are the twin important source of energy for cooking in the urban sector and about 30% of the households are using each of this sources. There has been an increase in the use of gas by 7.3% of the households and a decrease of 7% in the households using firewood/chips since 1987-88.
- ⇒ Among the urban households 23.2% use kerosene as the primary source of energy for cooking, an increase of 4% since 1987-88.
- ⇒ Average Indian households having “no cooking arrangement” is nine times in urban sector(6.3%) than in rural sector(0.7%).

---

# Chapter One

---

## Introduction

---

**1.0 Background :** The 50th round of NSS was the fifth quinquennial survey on consumer expenditure. The previous four quinquennial surveys were the 27th (Oct. 1972 - Sept. 1973), the 32nd (July 1977 - June 1978), the 38th (Jan-Dec. 1983), and the 43rd (July 1987- June 1988) Rounds of NSS. In other rounds, too, consumer expenditure inquiry on a lesser scale is being carried out starting from the 42nd round (1986-87) onwards side by side the main topic of enquiry. From the 45th round onwards the subject coverage of this schedule has been broadened to include some important aspects of questions on employment so that an annual series of consumer expenditure and employment data becomes available. While some of these smaller-scale surveys are conducted over a period of 12 months or six months, the quinquennial (full-scale) surveys have all been of complete year's duration.

1.1 In the quinquennial surveys two separate schedules are canvassed - sch.1.0 for consumer expenditure and sch.10 for employment situation - in each sample household, enabling thereby cross-tabulation of variates on consumer expenditure and employment. The present report, however, is based on schedule 1.0 only, enlightening primarily on different aspects of sources of energy used for cooking & lighting by the Indian households

as apparent from the data collected through this schedule.

1.2 The survey period of the 50th round was from July 1993 to June 1994. The geographical coverage of the survey was to be the whole of the Indian Union except Ladakh and Kargil districts of Jammu & Kashmir, 768 interior villages of Nagaland and 172 villages in Andaman & Nicobar Islands which remain inaccessible throughout the year. However, certain districts of Jammu & Kashmir viz., Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramullah and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey coverage due to unfavourable field conditions.

1.3 In all, 115354 households were interviewed, spread over 6951 sample villages and 4650 sample blocks. Ten households were selected for survey in each selected village / urban block.

1.4 The survey period of one year was divided into four sub-rounds of three months each with allocation of equal numbers of sample villages and blocks to each of the four sub-rounds viz.,  
sub-round 1 : July-Sept'93;  
sub-round 2 : Oct.-Dec'93;  
sub-round 3 : Jan.-Mar'94;  
sub-round 4 : Apr.-June'94

1.5 The results thrown up by the survey are presented in the report from which an idea

---

regarding the primary source of energy used for cooking & lighting by the Indian households belonging to different monthly per capita expenditure classes can be made up. The primary source of energy used by a sample household has been identified as the one, major quantities of which are consumed by the household from amongst those available for the relevant purpose.

1.6 With a view to study the nature and extent of change in the distribution of households by monthly per capita expenditure class imposing the effect of adjustment of rent imputed for owned houses by urban households distributed over various rent classes, ancillary facts of information was sought in the ROUND besides those usually required for measuring

total consumer expenditure inclusive of monthly rent paid by the household.

1.7 Basing on the combined sample (both of sub-sample 1 & 2) data, this report summarises the detailed results of the survey on the aforestated matter. The Sampling Design and Estimation Procedure followed in this survey round is figuring in the following chapter. Chapter three briefly elaborates on the important concepts and definitions adopted in the survey and used in this report and the survey findings are examined in chapter four. The collection of detailed data tables are appended to the report.

---

---

---

# Chapter Two

---

## Sample Design & Estimation procedure

---

**2.0 Sample Design :** A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

**2.1 Sampling frame for fsu's :** In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 1.4) and the state/union territory being surveyed, as follows.

2.1.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.1.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for **all 4 sub-rounds** : Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

2.1.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.1.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.1.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

---

**2.2 Stratification** : As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.2.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.2.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

stratum	composition
1	towns with population less than 50,000
2	towns with population 50,000 - 199,999
3	towns with population 200,000 - 399,999
4	towns with population 400,000 - 999,999 : affluent areas
5	towns with population 400,000 - 999,999 : other areas
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1 million or more : other areas

**2.3 Allocation of sample** : The first-stage sample size for any state/union territory of India was allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.3.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to

---

stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.3.3 For Group B areas (see para 2.1), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per **1991** census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.4 **Selection of fsu's** : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.1, in the form of two independent sub-samples. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.4.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.5 **Selection of hamlet-groups/sub-blocks** : To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.6 **Selection of households** : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion

---

of the sample to the affluent sections of the population wherever they could be located.

**2.6.1 Rural** : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circular systematically after arranging the households in the stratum by "means of livelihood" ; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

**2.6.2 Urban** : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4,6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4,6 & 8, **two** sample

households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

**2.7 Sample size** : This report covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Statement 0, separately for rural and urban sectors.

## 2.8 Estimation Procedure

**2.8.1 Estimation of aggregates at sub-sample level** : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where  $\bar{Y}$  denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the **rural sector** of a state/u.t. **other than Arunachal Pradesh**,

$$\bar{Y} = \sum_s \frac{I}{n_s} \sum_i \frac{P_{si} D_{si}^*}{p_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

---

For the **rural sector** of Arunachal Pradesh,

$$\bar{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the **urban sector** of a state/u.t.,

$$\bar{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- i : sample village/block suffix
- t : second-stage stratum suffix
- j : sample household suffix
- D : number of hamlet-groups/ sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- p : population of sample village as in the sampling frame
- N : for the urban sector, number of blocks in the sampling frame
- n : number of sample villages/blocks surveyed in this sub-sample
- $\Psi_s$  : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum
- $N_{si}$  : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum which was used in selection of i-th sample village of the stratum
- $D^*$  : equals 1, if  $D = 1$   
equals  $D/2$  if  $D > 1$

The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

**2.8.3 Estimates of ratios :** The estimate of a ratio of the form  $R = Y/X$ , where Y and X are the population aggregates of two characters, is obtained as

$$\bar{R} = \frac{\bar{Y}}{\bar{X}}$$

where  $\bar{Y}$  and  $\bar{X}$  are estimates of Y and X obtained according to the procedure laid down in paras 2.8.1 and 2.8.2. Examples of ratio estimates are rates and percentages.

---

---

## 2.8.2 Estimation of aggregates for the combined sample (pooling sub-samples) :

**STATEMENT 0: NUMBER OF VILLAGES/BLOCKS ALLOTTED AND SURVEYED AND NUMBER OF  
SAMPLE HOUSEHOLDS AND PERSONS SURVEYED**

# Chapter Three

---

## Concepts and Definitions

---

3.0 The concepts & definitions as followed in the household consumer expenditure survey during 50th round are broadly in lines of recent past rounds. A few of those relevant to this report are given below :

3.1 **Household** : A group of persons normally living together and taking food from a common kitchen constitutes a household. The qualification "normally" extends to cover only temporary stay aways but not temporary visitors, in the group. Thus a member residing outside, in a hostel, for studies is counted outside the household of the remaining family member(s), but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. Among the twin criterion "Living together" is usually stressed upon rather than "sharing food from a common kitchen" in drawing the boundaries of a household in case both of them cannot be accommodated together due to mutual conflict; however, in the special case of a person taking food from the common family kitchen while regularly spending nights somewhere else (say in a shop or in a different house for sleeping) due to reasons of security of the shop or other insufficiencies in the family household premises, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a

hotel (say) is considered as one household only; similar condition being applicable to residential staff of such establishments.

3.2 **Household size** : The size of a household is a complete count of the household members.

3.3 **Household consumer expenditure** : The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the sum total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.3.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex-farm or ex-factory rate. For evaluating the

---

consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, total amount of money spent during the reference period for the purchase of goods and services is treated as consumption expenditure.

3.3.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the occasional guests & visitors whether during celebrations or otherwise. Transfer payments like charity, loan advance, etc. made by the household are not reconsidered to avoid duplicacy while counting them in payer household as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account there. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.3.3 The aforementioned procedure by which value of cooked meals served to others is accounted for in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. The variation of the number of

donors and recipients of free cooked meals are likely to be in opposite directions over the expenditure classes. As a matter of fact most of the donors of cooked meals will be in the upper MPCE classes whereas most of the recipients will be in the lower ones. The nutritional intake derived from the consumer expenditure survey data need to be presented taking care of this aspect.

3.4 **Reference period** : Consumption data appearing in this report were all collected with a reference period of "last 30 days", i.e. the 30 days just preceding the date of survey. The reference period used for the survey, in other words, was a "moving" one, varying from one household to another depending upon the day of canvass.

3.5 **Monthly per capita expenditure (MPCE)** : For a household, this is the total household consumer expenditure during a period of 30 days subdivided by household size. A person's MPCE is understood to be, the figure derived on the household to which he/she belongs.

3.6 **MPCE classes** : It is customary in NSS consumer expenditure reports, to present various estimates, including and state and all-India level values of different indicators, socio-economic or else like nutrition related and distributions of households and persons over different socio-economic classes and calorie intake level formed basing on categorisation of the population as per monthly expenditure per capita i.e. MPCE. As regards population during the 50th round, 12 categories were drawn up in each sector - rural and urban - as follows. For the rural (urban) sector, the class limits of MPCE were so chosen that each class, excepting for the two pair of classes one each at the ends, approximately contained an estimated 10%

of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some class limits common between the rural and urban sectors. Tabulation of results by MPCE class from the 43rd to the 49th round of NSS, incidentally, was done using MPCE classes derived in a similar way, using 43rd round MPCE data. In other words, the present updation of classification on MPCE is second to the one made during the 43rd round.

**3.6.1** The classification evolved now for the two sectors of population is as follows :

MPCE Level	Rural (Rs.)	Urban (Rs.)
1.	<b>below 120</b>	<b>below 160</b>
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825 - 1055
12.	<b>560 &amp; above</b>	<b>1055 &amp; above</b>

**3.7 Primary Source of Energy used for Cooking and Lighting** : The primary source of energy that is being used for the purposes of household cooking and lighting have been ascertained in this round of survey. If more than one type of energy is utilised by the household for the purpose, the primary or principal one on the basis of the volume of its use have been identified and recorded.

**3.7.1** The **sources of energy** used by the households are mainly seven for cooking & five for lighting which are enumerated below:

### **cooking**

- (1) coke/coal,
- (2) firewood and chips,
- (3) gas (coal, oil or L.P.G.),
- (4) gobar gas,
- (5) dung cake,
- (6) charcoal,
- (7) kerosene,

### **lighting**

- (1) kerosene,
- (2) other oil,
- (3) gas,
- (4) candle,
- (5) electricity,

Households not using any of these sources have been clubbed under "other sources" while those reporting no arrangements for cooking and/or lighting have been enumerated under the head "no lighting/cooking arrangement" in this adopted system.

# Chapter Four

## Energy used for cooking and lighting

4.0 In this chapter some general findings relating to primary source of energy used for cooking and lighting based on data collected in the NSS 50th round (July 1993 - June 1994) survey are presented along with a comparative picture of the earlier periods i.e. last two quinquennial rounds on household consumer expenditure.

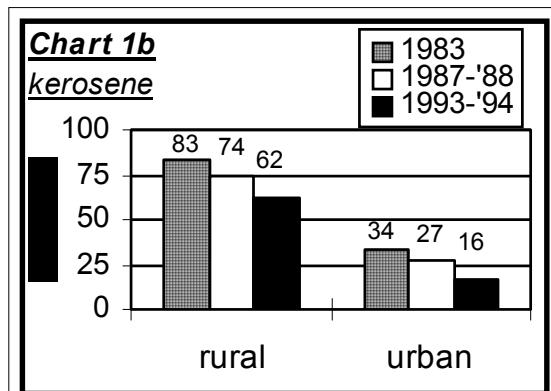

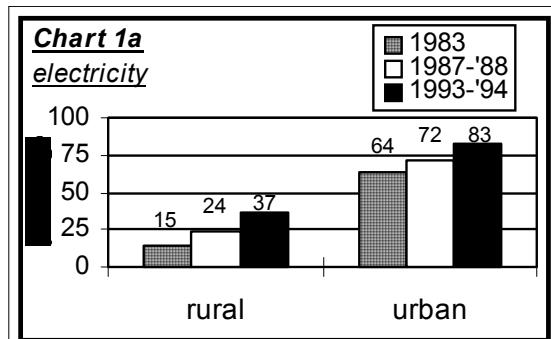

4.0.1 The three consecutive surveys (38th, 43rd & 50th) conducted during the decade 1983-93 have set up a specific trend in the pattern of use of various energy sources by Indian households for lighting & cooking on which an impression may be formed from the following discussion at the beginning. Detailed results on sources of energy for lighting & cooking available from the 50th Round Survey data is discussed later.

### 4.1 Trend in Distribution of households using different sources of energy for (i) lighting and (ii) cooking at the National level : NSS Roundwise

4.1.1 **Chart 1 (a & b)** shows distribution of households using major source of energy for lighting by NSS rounds at the national level. The use of electricity for lighting is observed to rise by about 22% in rural as against 19% in urban during the decade (1983 to 1993-94). *See chart 1(a)*

4.1.2 Side by side the number of households in both the sectors using kerosene for lighting is seen to be on the decline perhaps due to switching over to the

source of electricity as the facility becomes available to more and more households during the decade. *See chart 1(b)*

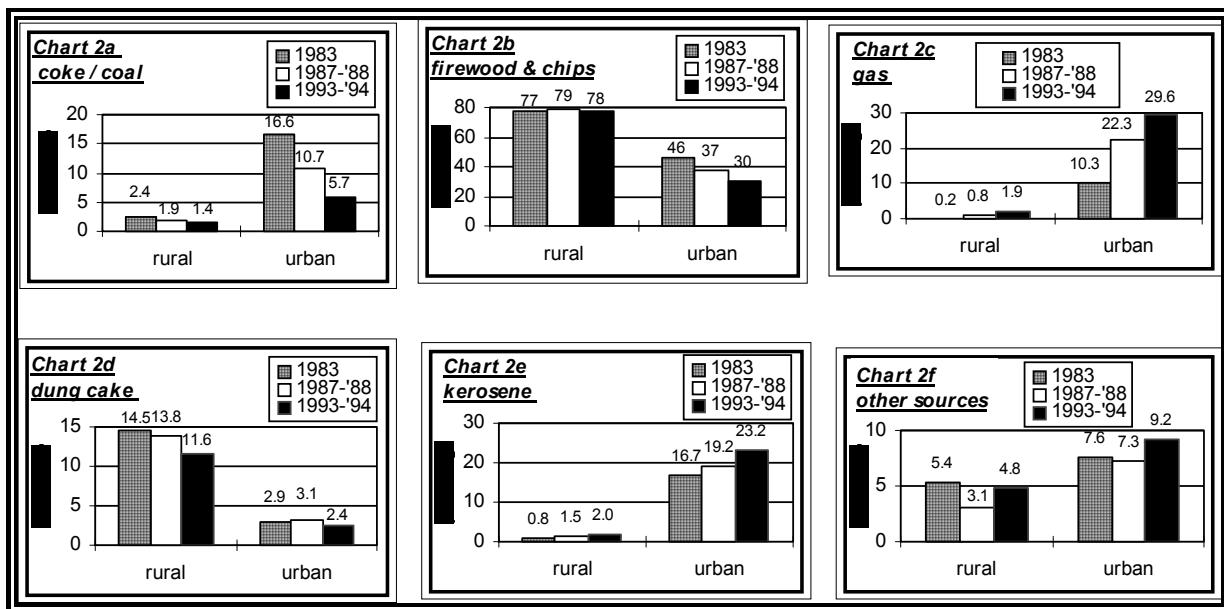

4.1.3 **Chart 2(a,b,c,d,e,f)** shows percentage distribution of households using different **source of energy for cooking** by NSS rounds at national level. It is observed that in the rural sector dependence of households on "dung cake", "coke & coal" & "others" has been observed to be on the fall by different extents over successive NSS rounds, whereas the use of kerosene

and gas by the rural households is on the rise. More or less constant percentage (77-79) of rural households is dependent upon "firewood & chips" as noticed from the

## Detailed results from NSS 50th round data

### 4.2 Distribution of households by

results of the three consecutive surveys.

4.1.4 In the urban sector, dependence of households on "coke/coal" and "firewood & chips" has decreased to different extents. More and more households are observed to switch over to energy sources like gas (incl. LPG) and kerosene for cooking. However a constant and minor percentage of households (2-3) is still observed to use "dung cake" in urban sector through-out the period (1983 to 1993-94).

4.1.5 In both the sectors dependence of household on 'other' sources has been observed to fluctuate by more or less the same i.e., 2% depending upon the number of households primarily not using the specific and enumerated energy sources for cooking.

**Primary source of energy for cooking (i) at the National level for each monthly per capita expenditure class (ii) at the state level.**

4.2.1 **Statements 1 and 2(R/U)** present the per thousand distribution of households according to the primary source of energy used by the households for cooking (i) at the National level for each MPCE class (ii) at the state level; in both the sectors of rural and urban.

4.2.2 **Statement 1** shows that " firewood & chips " is the most important & prevalent primary source of energy for cooking used by households in rural India with around 78% of the rural households dependent upon it perhaps due to its easy and cheap availability in large measure in rural sector. firewood & chips and gas (including LPG)

---

are the two equally preferred energy sources used by same proportion (around 30%) of urban households for cooking. Whereas the next important source is kerosene in urban sector with 23% of the households using, it is "dung cake" in rural sector with 12% of the households using for cooking.

4.2.3 It is worth noting that only around 2% of the rural households can afford using kerosene as primary source of energy for cooking and similar is the situation with gas.

4.2.4 Coke & coal are used by 1.4% of the households in the rural India as compared to 5.7% of the households in the urban India.

4.2.5 A point to mark in the data is that with increase in the MPCE level, increasing percentages of households tend to use gas & decreasing percentages of households continue using "firewood & chips" as the primary source of energy in both the sectors at the National level. Another remarkable feature of the data is that almost around a constant percentage (10-12) of households in all MPCE levels in the rural sector uses dung-cake as the primary source of energy for cooking, obviously due to domestic cattle being maintained by those households.

4.2.6 It is observed that percentage of households using '**other**' unenumerated sources of energy for cooking range from around 2 to 9 percent in the rural sector as against 1 to 4 percent in the urban sector amongst the various MPCE classes.

4.2.7 Only 0.7% of the households have no cooking arrangement in rural India whereas nine times of that i.e. 6.3% have no cooking arrangement in urban India possibly due to the reason of more number of hotels, restaurants and eating houses available which facilitate eating outside for the urban population. It is noticed that the percentage of households with "no cooking arrangement" is comparatively more in the highest and lowest MPCE classes and less in

the middle MPCE classes in both the sectors for economic reasons.

4.2.8 **Statement 2(R/U)** shows per 1000 distribution of households by primary source of energy for cooking for each of the major states.

4.2.9 It may be seen from **statement 2U** that, in the states of Bihar and West Bengal maximum percentage of households in the urban sector (39% & 30% respectively) use coke & coal for cooking, as extraction of coal is higher in these two states and more conveniently available in urban areas. Percentage of urban households using gas is very high in Punjab (41%), Gujarat (40%), Maharashtra (39%) and Haryana (39%) and very low in Kerala (17%), Bihar (17%), Orissa (18%), West Bengal (19%) and Tamil Nadu (19%) as compared with National level figure (30%). In the states of Maharashtra (38%) and Punjab (36%) larger percentages of households are dependent upon kerosene for cooking while in Kerala (5%) and Bihar (9%) smaller percentages of households as compared with the National level percentage (23%) are dependent upon this source in urban sector.

4.2.10 90% or more of the households in rural Rajasthan, Tamil Nadu, Madhya Pradesh, Kerala, Karnataka, Assam & Andhra Pradesh resort to the source "firewood & chip" for cooking as against 78% in rural India as is evident from **statement 2R**. Dung cake is used in comparatively more rural households of Punjab (34%), Uttar Pradesh (33%), Bihar (26%) and Haryana (25%) perhaps due to higher concentration of the cattle population in those states.

4.2.11 The situation of "no cooking arrangement" is more prevalent in urban households in general than rural households and particularly prominent in the urban areas of Tamil Nadu (12%), West Bengal (11%) and Orissa (10%).

---

#### **4.3 Distribution of households by primary source of energy for lighting (i) at the National level for each monthly per capita expenditure class (ii) at the state level.**

4.3.1 From **statement 3** it is observed that maximum percentage i.e. 62.1% of the rural households use kerosene as the primary source of energy for lighting. But kerosene is the second important primary source in the urban sector with 16.5% of the household using it and so is electricity for the rural sector wherein only 37.1% of the household enjoy the facility of electrification for lighting their houses, as against 82.8% of the households in the urban sector.

4.3.2 Kerosene & electricity are the twin prime source of energy for lighting in either of the sectors of India and more than 99% of the households are dependent upon them altogether

4.3.3 Whereas percentage of households using Kerosene as a primary source of energy for lighting is observed to fall, the percentage of households using electricity rises, with increase in the MPCE level, a phenomenon common to both the sectors.

4.3.4 It is also very rare to find "gas" being used as a primary source of lighting in the country.

4.3.5 A feature apparent in the data is that at least 45% of the urban households as compared against 15% of the rural households in each MPCE level use electricity for lighting purposes. A minimum of 90% or more of the households in the urban sector as against 40% or more in the rural sector in each of the uppermost

five MPCE classes could avail the facility of electricity for lighting. More than 28% in each MPCE class of rural sector and in each of the lower four MPCE classes of urban sector depend upon kerosene for lighting.

4.3.6 Per 1000 distribution of households by primary source of energy for lighting for each of the 15 major states is given in **statements 4R & 4U** for rural and urban sectors respectively.

4.3.7 In both the sectors, percentage of households using electricity as primary source of energy for lighting is minimum in Bihar(rural 6.4%, urban 65.3%) and maximum in Punjab (rural 87.3%, urban 95.9%), a contrast between the states, as may be seen from **statement 4 (R/U)**.

4.3.8 It is evident from the **statement 4U/4R** that electricity is the major source of energy for lighting in all the states of urban sector whereas in the rural sector, electricity is major in the states of Gujarat, Haryana, Karnataka, Kerala, Maharashtra, Punjab & Tamil Nadu and in the rest of the states Kerosene plays a dominant role. But in rural Andhra Pradesh an almost equal percentage(around 50) of households uses both the sources of energy viz., electricity and kerosene for lighting.

4.3.9 Kerosene as a primary source of energy for lighting is resorted to by maximum percentage of households of Bihar in either sector {92.8% in rural & 34.3% in urban} among the major states.

4.3.10 In both the sectors of all the states, at least 98% of households are dependent on either kerosene or electricity with remaining (less than 2%) lot going for sources like candle, gas etc. for lighting.
