

Report No. 424

# **Ownership of Livestock, Cultivation of Selected Crops and Consumption Levels**

**5th quinquennial survey  
of consumer expenditure**

**NSS 50th Round**

**July 1993 - June 1994**

**National Sample Survey Organisation**

**Department of Statistics**

**Government of India**

# PREFACE

---

---

*The National Sample Survey Organisation (NSSO) has been carrying out all-India surveys quinquennially on consumer expenditure and employment & unemployment since 27th round of socio-economic surveys. The fifth quinquennial survey on the subject was conducted in the 50th round of NSS (July 1993 - June 1994) using an all-India sample of 115354 households located in 6951 villages and 4650 urban blocks.*

*On the basis of the consumer expenditure survey, ten reports dealing respectively with level and pattern of consumer expenditure, consumption of some important commodities, nutritional intake, dwellings occupied, energy used, sources of household income, differences in level of consumption among socio-economic groups, adequacy of food intake, IRDP assistance & participation in public works and use of durable goods in India have been released. The present report is the eleventh of the series.*

*This report studies the differences in cereal consumption and extent of consumption from home-grown stock between non-grower and grower households. It also studies differences in proportion of households possessing milch and draught animals among different household categories.*

*The field work of the survey was done, as usual, by the Field Operations Division of the Organisation. The collected data was processed by the Data Processing Division of NSSO and tabulated by the Computer Centre of the Department of Statistics. The report has been prepared by the Survey Design and Research Division (SDRD) of the NSSO. I am thankful to the members of the Governing Council, Heads of various Divisions of the NSSO, the Executive Director, Computer Centre, and their colleagues for their contributions in preparing the report.*

*Comments/suggestions from the readers of the report will be most welcome.*

# Highlights

---

---

- In 1993-94, rice was cultivated by 40% of all households in rural India, wheat by 29%, jowar by 12%, bajra by 8%, and maize by 14% households.
  - Per capita cereal consumption was in general higher for cultivator households than for non-cultivator households.
  - In the country as a whole, the proportion of households growing these crops by consumption met out of own produce was 64% for rice, 69% for wheat, 53% for jowar and bajra, and 68% for maize.
  - In rice-growing households, home produce of cereals other than rice accounted for 60% of consumption. Similarly, home produce accounted for 55-65% of non-wheat cereal consumption of wheat growers, non-jowar cereal consumption of jowar growers, non-bajra cereal consumption of bajra growers, and non-maize cereal consumption of maize growers.
  - Consumption out of own produce by rice-growing households accounted for 37% of rice consumption in the country as a whole, and consumption out of own produce by wheat-growing households accounted for 43% of the country's wheat consumption, in 1993-94.
  - 47% of rural households in India possessed at least one milch animal in 1993-94. 43% possessed at least one cow or buffalo.
  - About 30% households in rural India possessed at least one draught animal in 1993-94.
  - 72% of households self-employed in agriculture possessed at least one milch animal, compared to less than 34% of households engaged in other occupations. Again, 55% of households self-employed in agriculture possessed at least one draught animal, compared to 13-16% for households in other occupations.
  - Among the ST households in rural India, 44% possessed at least one draught animal, compared to 31% of "others" (non-SC/ST), and only 20% of SC households.
  - Percentage of rural households possessing milch and draught animals increased rapidly with an increase in the size of land possessed.
  - Percentage of rural households possessing milch animals increased with overall expenditure level over a large part of the MPCE (monthly per capita expenditure) range. Percentage of households possessing draught animals increased with MPCE up to a certain MPCE level and declined thereafter.

# Chapter 1

## Introduction

1.0 This is the eleventh of a series of reports based on NSSO's fifth quinquennial survey on consumer expenditure conducted in 1993-94 as part of the 50th "round" of NSS. In this survey the NSS household consumer expenditure schedule was canvassed in 115354 households in 6951 villages and 4650 urban blocks spread over the entire geographical area of the country. The coverage of this particular report is restricted to rural India. It deals mainly (Chapter 4) with the cereal consumption levels of a very important section of the rural population of India: the cereal-growing households. In addition, it provides (Chapter 5) certain estimates relating to possession of milch and draught animals by different sections of the rural population.

### **Cereal consumption of cereal-growing households**

1.1 Seven important cereals were considered in this survey: rice, wheat, jowar, bajra, maize, barley and ragi. Each household was asked whether it had cultivated rice during the last 365 days, and thus classified as "rice-growing" or "non-rice-growing", and similarly for wheat, jowar, etc.

1.2 The consumer expenditure schedule, which was canvassed in all the sample households, collects, inter alia, information on total quantity and value of consumption of each of the seven cereals under consideration by the household members during the 30 days prior to the date of

survey. Consumption of each cereal out of home-grown stock (if any) is further ascertained separately.

1.3 Based on this information, this report studies differences in total cereal consumption, consumption of particular cereals, and extent of consumption coming from home-grown stock among growers of different cereals in rural areas of different states and u.t.'s of the country. Distributions of rural households growing specific cereals by monthly per capita expenditure class are also presented for each state and u.t.

### **Possession of milch and draught animals**

1.4 Each sample household was asked whether it possessed (on the date of survey) cows or buffaloes or both and if not, whether it possessed any other milch animal. Households were, further asked whether they had any draught animal, and if so, whether they possessed one, or more than one.

1.5 Based on this information, and on information collected on the social group, occupational type, and monthly per capita expenditure of the sample households, differences are studied in the percentages of households possessing milch and draught animals over states and union territories, social groups, occupational types, and levels of monthly per capita expenditure.

### **Notes**

**1. The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir. In the 50th round, certain other districts of Jammu & Kashmir, viz. Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramula and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey due to unfavourable field conditions.

**2. Household consumer expenditure survey:** It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature. It was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. An annual series of smaller-scale consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be most useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. The five quinquennial surveys of consumer expenditure have been those of the 27th, 32nd, 38th, 43rd and 50th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88 and 1993-94.

# Chapter 2

## Sample design

2.0 **Sample Design:** A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 The survey period of one year was divided into four **sub-rounds** of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

	1	July - Sept 1993
sub-	2	Oct - Dec 1993
rounds	3	Jan - Mar 1994
	4	Apr - June 1994

2.2 **Sampling frame for fsu's:** In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

2.2.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.2.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

2.2.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.2.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.2.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.3 **Stratification** : As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region

formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.3.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.3.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

stratum	composition
1	towns with population less than 50000
2	towns with population 50000 - 199999
3	towns with population 200000 - 399999
4	towns with population 400000 - 999999 - affluent areas
5	towns with population 400000 - 999999 - other areas
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1

million or more : other areas

2.4 Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent **sub-samples**. Either of these sub-samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

2.5 **Allocation of sample:** The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.5.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.5.3 For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4

combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per 1991 census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

**2.6 Selection of fsu's:** Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent **sub-samples**. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

**2.6.1** In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

**2.7 Selection of hamlet-groups/sub blocks**  
To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of

two hamlet-groups, two EB's from the constituent EB's of large villages.

**2.8 Selection of households:** The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

**2.8.1 Rural:** In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circular systematically after arranging the households in the stratum by "means of livelihood" ; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

**2.8.2 Urban:** In sample blocks, households with monthly per capita consumer

expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4,6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4,6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

**2.9 Sample size:** The survey covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately for rural and urban sectors.

## 2.10 Estimation Procedure

**2.10.1 Estimation of aggregates at sub-sample level :** Aggregates are first estimated at sub-sample level according to the following estimation formulae, where  $\bar{y}^{\square}$  denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the rural sector of a state/u.t. other than Arunachal Pradesh,

$$\bar{y}^{\square} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}^*}{p_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\bar{y}^{\square} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\bar{y}^{\square} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- t : second-stage stratum suffix
- i : sample village/block suffix
- j : sample household suffix
- D : number of hamlet-groups/sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- p : population of sample village as in the sampling frame
- N : for the urban sector, number of blocks in the sampling frame
- n : number of sample villages/blocks surveyed in this sub-sample
- Psi : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum
- Nsi : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum which was used in selection of i-th sample village of the stratum
- D\* : equals 1, if D = 1  
equals D/2 if D > 1

**2.10.2 Estimation of aggregates for the combined sample (pooling subsamples):**

The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

**2.10.3 Estimates of ratios:** The estimate of a ratio of the form  $R = Y/X$ , where Y and X are the population aggregates of two characters, is obtained as

$$\bar{R} = \frac{\bar{Y}}{\bar{X}}$$

where  $\bar{Y}$  and  $\bar{X}$  are estimates of Y and X obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

# Chapter 3

## Concepts and Definitions

**3.0 Household:** A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

**3.1 Household consumer expenditure:** The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

**3.1.1** For groups (i) and (ii), the total value of consumption is derived by aggregating the

monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered as consumption.

**3.1.2** It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan advance, etc. made by the household are not considered as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from

employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.1.3 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept firmly in mind while using the NSS consumer expenditure data for any nutritional studies relating to the nutritional status of households.

3.2 **Reference period:** Consumption data appearing in this report were all collected with a reference period of “last 30 days”, i.e. the 30 days immediately preceding the date of survey. The reference period used for the survey, in other words, was a “moving” one, varying from household to household.

3.3 **Major states:** This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.4 **Value of consumption:** Consumption out of purchase is evaluated at the purchase

price. Consumption out of home produce is evaluated at ex farm or ex factory rate. Value of consumption out of gifts, loans, free collection, and goods received in exchange of goods and services is imputed

at the rate of average local retail prices prevailing during the reference period.

3.5 **Consumption out of home-grown stock:** Home-grown stock refers to crops grown by households in their own farm and crop received as rent on land leased out. Produce brought from village home and consumed at urban residence is also included. Valuation excludes transport charges for carrying the commodity to the place of residence for consumption.

3.6 **Rice:** Consumption of **rice** includes consumption of rice products such as rice flakes, puffed rice, etc. Similarly **wheat** consumption includes consumption of all wheat products including *atta*, *maida*, *bread*, *noodles*, etc. Likewise, consumption of **Jowar, Bajra** etc. includes consumption of their products.

3.7 **Household size:** The size of a household is the total number of persons in the household.

3.8 **Monthly per capita expenditure (MPCE):** For a household, this is household consumer expenditure over a period of 30 days divided by household size. A person's MPCE is understood as that of the household to which he/she belongs.

3.9 **MPCE classes:** It is the usual practice, in NSS consumer expenditure reports, to present various estimates, including state and all-India level values of different socio-economic indicators, and distributions of households and persons over different socio-economic categories or statuses, separately for a number of classes of the population formed on the basis of MPCE. For the 50th round, 12 MPCE classes were drawn up for each sector - rural and urban - as follows. For the rural (urban) sector, the class limits were so chosen that each class, excepting the top two classes and the bottom two, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some

adjustments were, however, made to keep some common class limits for the rural and urban sectors. The same procedure using 43rd round population estimates, was used to draw up the MPCE classes used for tabulation of consumer expenditure data from the 43rd round to the 49th round, uniformly. The present classes represent the first updation of the MPCE classification since the 43rd round. The classes are:

	RURAL	URBAN
	(Rs)	(Rs)
1.	below 120	below 160
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825 - 1055
12.	560 & above	1055 & above

**3.10 Household type:** Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household members. The five types of rural households are *self-employed in non-agriculture, agricultural labour, other labour, self-employed in agriculture, and other households*. The four types of urban household are: *self-employed, regular wage / salary earner, casual labour, and other households*. The “type” of a household was determined as follows.

#### Rural

**3.10.1** A household was classified as “agricultural labour”, if its income from that source was 50% or more of its total income. The same criterion was followed to classify a household as “self-employed in agriculture”. A household was classified as “self-employed in non-agriculture” if its

income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as “other labour”. The remaining households were classified as “other households”.

#### Urban

**3.10.2** A household was classified as “self-employed”, “regular wage or salary earning”, or “casual labour”, according to the major sources of its income from “gainful employment” during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under “others”.

**3.11 Household group:** Three social groups were distinguished - scheduled tribe, scheduled caste, and other households.

**3.12 Land possessed:** The area of land possessed includes land owned, leased in, and (encroached) land neither owned nor leased in, but excludes land leased out.

**3.13 Rice-growing households (or rice growers):** Households which reported cultivation of rice during the 365 days prior to the date of survey. **Wheat-growing households, jowar-growing households,** etc. are defined similarly.

**3.14 Possession of milch and draught animal:** “Possession” is understood as possession on the date of survey.

# Chapter 4

## Cereal consumption of cereal growers

4.0 The present chapter explores differences in consumption of particular cereals among growers of different kinds of cereals. "Grower households", for each of the seven cereals rice, wheat, jowar, bajra, maize, barley and ragi, are those which reported cultivation of the cereal during the 365 days preceding the date of survey.

4.1 Tables 1R to 7R of the Appendix give quantity and value of monthly consumption of each cereal (including its products), and how much of consumption was out of home produce, for growers and non-growers of rice (1R), wheat (2R), and so on up to ragi (7R).

4.2 For each of the seven different cereals - rice, wheat, jowar, bajra, maize, barley, and ragi - the percentage of households in each state/u.t. undertaking cultivation during the reference period is shown in Table T1. Details of the size of population accounted by these households, and the number of such households and persons surveyed, are provided in Tables 8R to 14R of the Appendix. In Table T2, monthly per capita rural consumption of each cereal (and its products) is shown for the different states and u.t.'s.

4.2.1 The all-India percentages of households cultivating rice and wheat were 40% and 29%. All-India monthly per capita consumption was 7.02 kg for rice and 4.40 kg for wheat. Though 12% of all households cultivated some jowar and 14%, some maize, all-India per

capita consumption of jowar was under 1 kg per month and of maize, less than 400 gm. Comparison of the all-India rows of Tables T1 and T2 shows, in fact, that per household production was much greater for rice and wheat than for the other five crops.

4.2.2 The major state with the lowest percentage of households engaged in cultivation of any cereal was, undoubtedly, Kerala, which also showed the least tendency towards diversification of cultivation. Diversified cultivation was most noticeable in Uttar Pradesh, Rajasthan, Gujarat, Madhya Pradesh, Maharashtra, Haryana, Himachal Pradesh, J & K, and Karnataka, which means in the western half of the country, and in Bihar.

4.2.3 The percentage of households growing rice was at least 10% in each of the 15 major states except Rajasthan, and at least 20% in 11 of these states. On the other hand, wheat-growing households formed more than 10% of households in only 9 major states. Maize was an important second crop in many of the smaller states and was also important in M.P., Rajasthan and U.P.

### **General features of cereal-growing households: average household size and per capita cereal consumption**

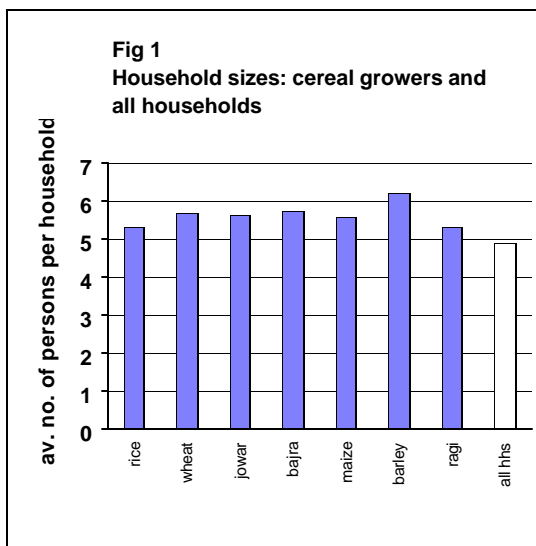

4.3 **Grower households are larger.** Along with Tables 23R to 29R, percentage of

grower households for each cereal in each state is given, and percentage of persons in the population belonging to such households.

4.3.1 For any particular cereal the percentage of grower households in a state is seen, by and large, to be slightly less than the percentage of persons in such households to total population. Thus, while 34.0% of Andhra Pradesh households are rice-growing, their members form 37.8% of the state's population. Using the all-India Tables 23R to 29R and the all-India

average household size for rural areas (NSS Report No. 402), average sizes of grower households for all the seven cereals and that of all households have been worked out and are shown in Fig 1. The figure shows that average size of grower households exceeds 5 for all seven cereals (being > 5.5 for as many as five of the seven cereals), while the average size of all households (growers and non-growers) is 4.9. This implies that grower households are, on the average, larger in size than non-grower households.

**4.4 Grower households consume more cereals per person.** It is also evident (see Fig 2) that per capita cereal consumption (all

cereals) is greater for grower households than the average for all households, for all cereals except wheat.

**4.5 Zero consumption by growers.** In rural Haryana, no jowar was consumed by the 13% households which reported jowar cultivation. In Punjab, the 4% households reporting cultivation of jowar and the 3% households reporting cultivation of bajra also reported zero consumption of these crops. Bajra was also not consumed in J & K (9% households reported cultivation) and Himachal Pradesh (2% reported cultivation).

*In Table T5 a '-' is used to indicate that no household in the sample grew for the relevant cereal, while a '0' indicates that the consumption of the cereal by households growing it was zero. '0' is seen to appear in the growers column against quite a number of states for jowar, bajra, barley and ragi, but the number of grower households in most of these cases is small.*

### Share of home produce in total consumption of growers

4.6 Table T6 gives, for each of the seven cereals, how much (what percentage) of the grower households' consumption of (a) that cereal (b) other cereals, comes from home produce in the different states and u.t.'s of India. The following features are noticed.

4.6.1 Proportion of growers' consumption out of own produce is 64% for rice, 69% for wheat, 53% for jowar and bajra, and 68% for maize considering the country as a whole. For each of these crops, the proportion of growers' consumption of "other cereals" from home produce works out to about 55-65% at the all-India level. Nearly the entire barley consumption of barley growers was out of home produce.

home produce was generally quite high (frequently 60% or more) and often as high as the home-grown component (percentage) of their wheat consumption (see Table T4). In the predominantly rice-consuming and rice-growing states (e.g. Andhra Pradesh, Assam, Kerala, Orissa and West Bengal), on the other hand, the home-grown component of "other cereals" consumption was much lower and rarely exceeded 30%. Exceptions are some of the north-eastern states where maize is the other important crop besides rice.

4.6.3 Next to barley, maize shows the highest proportions of growers' consumption met out of home produce (75% or more in 16 of the 29 states and u.t.'s where cultivation was reported).

Table T3: Percentage of "other cereals" consumption coming from home produce: difference between rice and wheat growers			
selected states with wheat the major crop	wheat growers: share of home produce in non-wheat cereal consn.	selected states with rice the major crop	rice growers: share of home produce in non-rice cereal consn.
Gujarat	35	Andhra Pradesh	22

Madhya Pradesh	63	Kerala	1
Punjab	73	Orissa	1
Rajasthan	68	Tamil Nadu	28
Uttar Pradesh	67	West Bengal	28

4.6.2 In states where wheat is an important crop (e.g. Bihar, Haryana, Punjab, Rajasthan, Uttar Pradesh) the percentage of wheat growers' consumption of "other cereals" from

### Percentage of cereal consumption of state made directly by growers out of home produce

4.7 In Table T4, consumption by growers out of home produce is shown as a percentage of the total consumption (by growers and non-growers) of the state, for rice, wheat, jowar, bajra, maize and barley. The all-India row, as in Table T6, shows a higher percentage (43%) for wheat than for rice (37%) and higher percentages for rice and wheat than for jowar and bajra. About one-half of maize consumption in the country is seen to have been made directly by growers out of own produce. For barley the percentage is 93, the same as the percentage in Table T6, consumption by non-growers being, as was noted earlier, practically negligible.

4.8 In Table 15R of the Appendix, distributions of rural households by monthly per capita expenditure class are given separately for households growing rice,

households growing wheat, households growing jowar, and so on for all seven cereals, and for households growing any of these cereals.

# Chapter 5

## Possession of milch and draught animals

5.0 This chapter studies differences in proportions of households possessing milch and draught animals, among different household types, social groups and households in different size classes of land possessed.

### Possession of milch and draught animals

5.1 Table 16R gives two distributions of rural households for each state/u.t. One relates to type of milch animal possessed. Households possessing at least one bovine are classified into three groups - "cows only", "buffaloes only" and "both cows and buffaloes". "Others" were households with no bovine but at least one milch animal. The other distribution is that of number of draught animals possessed by households: a pair or more, single, or none.

5.2 **Inter-state variation:** At the all-India level, 468 households per 1000 are seen to have reported possessing milch animals, and of these, 431 possessed at least one cow or buffalo. Rajasthan was the only major state with a high proportion of households - 165 per 1000 - in the "others" (possessing non-bovine milch animals) category, which contained only 34 per 1000 of households at the all-India level. Inter-state variation in

proportions of households in the different categories is very wide. About 30% households in the country possessed at least one draught animal. The proportion (i.e. the proportion possessing a pair or more) is greatest in Madhya Pradesh and lowest (among the major states) in Kerala.

5.3 Tables 17R, 18R, 19R and 20R (Appendix) present all-India distributions of rural households by type of milch animal possessed, and number of draught animals possessed, separately for different household types (Table 17R), social groups (Table 18R), size classes of land possessed (Table 19R), and MPCE classes (Table 20R). In these tables, the columns provide, alternately, per 1000 distributions and average MPCE comparisons over the different classes.

5.4 **Variation with household type:** Table 17R shows that 72% (1000 minus 280 per 1000) of rural households *self-employed in agriculture* can be seen to possess at least one milch animal while in all other household types the percentage is under 34%. The percentage possessing at least one draught animal is also much greater for this class of households (55%) than for the other classes (13-16%).

5.5 **Variation with social group:** It can be seen from Table 18R that 44% of ST

households in rural India had at least one draught animal, compared to 31% for "others" and only 20% for SC.

**5.6 Variation with size of land possessed:** It can be seen from Table 19R that possession of milch animals and draught animals *increases* rapidly as one moves from the lower size classes of and possessed to the higher classes.

**5.7 Variation with MPCE (Table 20R):** Up to the highest MPCE class but one (Rs. 455-560) the proportion of households possessing milch animals is found to rise with increase in MPCE, from 30% to about 54%. The proportion possessing non-bovine milch animals ("other"), however, falls as MPCE increases. Proportion possessing draught animals, after a gradual rise with MPCE up to the class Rs. 210-235, starts declining gradually.

# **Appendix**

## **Detailed tables**
